OFFICE OF INSPECTOR GENERAL

(SPECIAL REVIEW b)(3) NatSecAct
	COUNTERTERRORISM DETENTION AND INTERROGATION ACTIVITIES (SEPTEMBER 2001 - OCTOBER 2003) (2003-7123-IG)
(b)(1)	7 May 2004
(b)(1) (b)(3) N atSe	Act INTRODUCTION
(b)(1)	1. On 17 September 2001, the President signed a Memorandum of Notification (MON) (b)(1) (b)(3) NatSecAct One of the key weapons in the war on terror was the MON authorization for CIA to "undertake operations designed to capture and detain persons who pose a continuing, serious threat of violence or death to U.S. persons and interests or who are planning terrorist activities."
(b)(3) NatSecA	Operations (DDO) informed the Office of Inspector General (OIG) that the Agency had established a program in the Counterterrorist Center to detain and interrogate terrorists at sites abroad ("the CTC Program"). He also informed OIG that he had just learned of and had
(b)(1) (b)(3) NatSecAc	dispatched a team to investigate the death of a detainee, Gul Rahman, In January 2003, the DDO informed OIG that he had received allegations that Agency personnel had used unauthorized interrogation techniques with a detainee, 'Abd Al-Rahim Al-Nashiri, at another foreign site, and requested that

OIG investigate. Separately, OIG received information that some employees were concerned that certain covert Agency activities at an overseas detention and interrogation site might involve violations of human rights. In January 2003, OIG initiated a review of Agency counterterrorism detention and interrogation activities and investigations into the death of Gul Rahman and the incident with Al-Nashiri.¹ This Review covers the period September 2001 to mid-October 2003.2 Results of the Gul Rahman and Al-Nashiri-related investigations are the subject of separate reports.

	(b)(3)

in March 2002, presented the Agency with a significant dilemma.⁴ The Agency was under pressure to do everything possible to prevent additional terrorist attacks. Senior Agency officials believed Abu Zubaydah was withholding information that could not be obtained through then-authorized interrogation techniques. Agency officials believed that a more robust approach was necessary to elicit threat information from Abu Zubaydah and possibly from other senior Al-Qa'ida high value detainees.

(b)(1) (b)(3) NatSecAct

The conduct of detention and interrogation activities presented new challenges for CIA. These included determining where detention and interrogation facilities could be securely located and operated, and identifying and preparing qualified personnel to manage and carry out detention and interrogation activities. With the knowledge that Al-Qa'ida personnel had been trained in the use of resistance techniques, another challenge was to identify interrogation techniques that Agency personnel could lawfully use to overcome the resistance. In this context, CTC, with the assistance of the Office of Technical Service (OTS), proposed certain more coercive physical techniques to use on Abu Zubaydah. All of these considerations took place against the backdrop of pre-September 11, 2001 CIA avoidance of interrogations and repeated U.S. policy statements condemning torture and advocating the humane treatment of political prisoners and detainees in the international community.

(b)(1) And detainees in the international conditions.

(b)(3) NatSecAct

6. (TS.) The Office of General Counsel (OGC) took the lead in determining and documenting the legal parameters and constraints for interrogations. OGC conducted independent research (b)(3) NatSecAct

3 (b)(1) (b)(3) NatSecAct Approved for Release: 2016/06/10 C05856717

The use of "high value" or "medium value" to describe terrorist targets and detainees in this Review is based on how they have been generally categorized by CTC. CTC distinguishes targets according to the quality of the intelligence that they are believed likely to be able to provide about current terrorist threats against the United States. Senior Al-Qa'ida planners and operators, such as Abu Zubaydah and Khalid Shaykh Muhammad, fall into the category of "high value" and are given the highest priority for capture, detention, and interrogation. CTC categorizes those individuals who are believed to have lesser direct knowledge of such threats, but to have information of intelligence value, as "medium value" targets/detainees.

•	•	· ·

and consulted extensively with Department of Justice (DoJ) and National Security Council (NSC) legal and policy staff. Working with DoJ's Office of Legal Counsel (OLC), OGC determined that in most instances relevant to the counterterrorism detention and interrogation activities under the MON, the criminal prohibition against torture, 18 U.S.C. 2340-2340B, is the controlling legal constraint on interrogations of detainees outside the United States. In August 2002, DoJ provided to the Agency a legal opinion in which it determined that 10 specific "Enhanced Interrogation Techniques" (EITs) would not violate the torture prohibition. This work provided the foundation for the policy and administrative decisions that guide the CTC Program.

	13. (TS/) During the period covered by this	
(b)(1)	Review, did not uniformly document or report the ecActatment of detainees, their conditions, or medical care provided.	
(b)(3) NatSe	Because of the lack of guidance, limited personnel resources, and	
(b)(1)	limited oversight, there were instances of improvisation and other	
(b)(1) (b)(3) N atSe	_{cAct} idocumented interrogation techniques In November	
· / · /	2002, one individual—Gul Rahman—died as a result of the way he	
(b)(1)	was detained there.	
(b)(3) NatSed	cAct 14. (TS/ There is no indication that the CTC	
	Program has been inadequately funded. Across the board, however,	
	staffing has been and continues to be the most difficult resource	
	challenge for the Agency. This is largely attributable to the lack of	
	personnel with interrogations experience or requisite language skills	
(I-) (A)	and the heavy personnel demands for other counterterrorism	
(b)(1) (b)(3) NatSe	assignments.	
(-)(-)	15. (TS/ Agency efforts to provide systematic,	
	clear and timely guidance to those involved in the CTC Detention	
	and Interrogation Program was inadequate at first but have	
	improved considerably during the life of the Program as problems have been identified and addressed. CTC implemented training	
	programs for interrogators and debriefers. 6 Moreover, building upon	
(b)(1)	operational and legal guidance previously sent to the field, the DCI	
(b)(3) NatSe	cAct	
	Before 11 September (9/11) 2001, Agency personnel sometimes used the	
	terms interrogation/interrogator and debriefing/debriefer interchangeably. The use of these terms has since evolved and, today, CTC more clearly distinguishes their meanings. A debriefer engages a	
	detainee solely through question and answer. An interrogator is a person who completes a two-week interrogations training program, which is designed to train, qualify, and certify a	
	person to administer EITs. An interrogator can administer EITs during an interrogation of a	
	detainee only after the field, in coordination with Headquarters, assesses the detainee as withholding information. An interrogator transitions the detainee from a non-cooperative to a	
	cooperative phase in order that a debriefer can elicit actionable intelligence through non-aggressive techniques during debriefing sessions. An interrogator may debrief a detainee	·
	during an interrogation; however, a debriefer may not interrogate a detainee.

	(b)(b) Natoconct	

on 28 January 2003 signed "Guidelines on Confinement Conditions for CIA Detainees" and "Guidelines on Interrogations Conducted Pursuant to the Presidential Memorandum of Notification of 17 September 2001." The DCI Guidelines require individuals engaged in or supporting interrogations pursuant to programs implementing the MON of September 2001 be made aware of the guidelines and sign an acknowledgment that they have read them. The DCI Interrogation Guidelines make formal the existing CTC practice of requiring the field to obtain specific Headquarters approvals prior to the application of all EITs. Although the DCI Guidelines are an improvement over the absence of such DCI Guidelines in the past, they still leave substantial room for misinterpretation and do not cover all Agency detention and interrogation activities.

(b)(3) NatSecAct

(b)(1)

16. (TS ______ The Agency's detention and interrogation of terrorists has provided intelligence that has enabled the identification and apprehension of other terrorists and warned of terrorist plots planned for the United States and around the world. The CTC Program has resulted in the issuance of thousands of individual intelligence reports and analytic products supporting the counterterrorism efforts of U.S. policymakers and military commanders.

(b)(1) (b)(3) NatSecAct

17. (TS/______ The current CTC Detention and Interrogation Program has been subject to DoJ legal review and Administration approval but diverges sharply from previous Agency policy and rules that govern interrogations by U.S. military and law enforcement officers. Officers are concerned that public revelation of the CTC Program will seriously damage Agency officers' personal reputations, as well as the reputation and effectiveness of the Agency itself.

(b)(1) it (b)(3) NatSecAct

18. (TS/ recognized that detainees may be held in U.S. Government custody indefinitely if appropriate law enforcement jurisdiction is not asserted. Although there has been ongoing discussion of the issue inside the Agency and among NSC,

(b)(1)TOP SECRET (b)(3) NatSecAct (b)(3) NatSecAct 21. (TS/ the General Counsel should seek an updated legal opinion from DoJ revalidating and modifying, consistent with actual practice, the legal authority for the continued application of EITs. If such approval is not forthcoming, the DCI should direct that EITs be implemented only within the parameters of the existing written DoJ authorization. The DCI should brief the President on the use of EITs and the fact that detainees have died. (b)(5)

(b)(1)

(b)(5)

BACKGROUND

22. (S) The Agency has had intermittent involvement in the interrogation of individuals whose interests are opposed to those of the United States. After the Vietnam War, Agency personnel experienced in the field of interrogations left the Agency or moved to other assignments. In the early 1980s, a resurgence of interest in teaching interrogation techniques developed as one of several methods to foster foreign liaison relationships. Because of political sensitivities the then-Deputy Director of Central Intelligence (DDCI) forbade Agency officers from using the word "interrogation." The Agency then developed the Human Resource Exploitation (HRE) training program designed to train foreign liaison services on interrogation techniques.

23. (S) In 1984, OIG investigated allegations of misconduct on the part of two Agency officers who were involved in interrogations (b)(3) NatSecAct the death of one individual Following that investigation, the Agency took steps to ensure Agency personnel understood its policy on-

TOP SECRET/	(b)(1) (b)(3) NatSecAct	
-------------	----------------------------	--

interrogations, debriefings, and human rights issues. Headquarters sent officers to brief Stations and Bases and provided cable guidance to the field.

24. (S) In 1986, the Agency ended the HRE training program because of allegations of human rights abuses in Latin America.

(b)(1)

(b)(3) NatSecAct

DO Handbook 50-2

(b)(3) CIAAct

which remains in effect, explains the Agency's general interrogation policy:

It is CIA policy to neither participate directly in nor encourage interrogation that involves the use of force, mental or physical torture, extremely demeaning indignities or exposure to inhumane

treatment of any kind as an aid to interrogation.

DISCUSSION

GENESIS OF POST 9/11 AGENCY DETENTION AND INTERROGATION ACTIVITIES

b)(1))	
b)(3)) NatSecAct 25. (TS/	The statutory basis for CIA's involvement
	in detentions and interro	gations is the DCI's covert action
÷	responsibilities under the	e National Security Act of 1947, as amended. ⁷
:	Under the Act, a covert a	ction must be based on a Presidential
	"finding that the action is	necessary to support identifiable foreign
į	policy objectives and is in	mportant to the national security."8 Covert
;	•	n writing and "may not authorize any action
!	that would violate the Co	onstitution or any statute of the United
1	States."9 These findings a	are implemented through Memoranda of
}	Notification.	

(b)(1) (b)(3) NatSecAct 26. (TS) (b)(1) The 17 September 2001 MON (b)(3) NatSecAct authorizes

the DCI, acting through CIA, to undertake operations "designed to capture and detain persons who pose a continuing, serious threat of violence or death to U.S. persons and interests or who are planning terrorist activities." Although the MON does not specifically mention interrogations of those detained, this aspect of the CTC Program can be justified as part of CIA's general authority and responsibility to collect intelligence.¹⁰

27. (S//NF) The DCI delegated responsibility for implementation of the MON to the DDO and D/CTC. Over time, CTC also solicited assistance from other Agency components, including OGC, OMS, OS, and OTS.

⁷ (U//FOUO) DoJ takes the position that as Commander-in-Chief, the President independently has the Article II constitutional authority to order the detention and interrogation of enemy combatants to gain intelligence information.

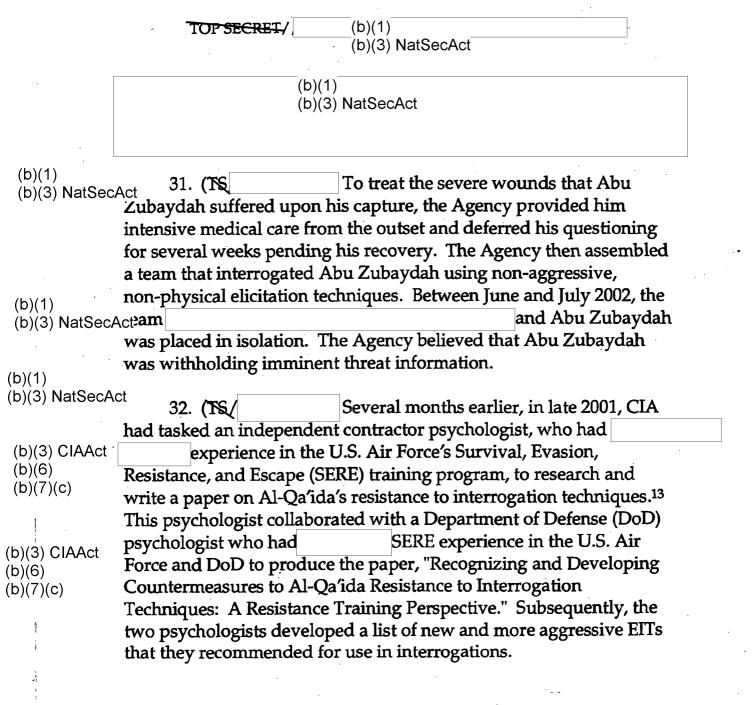

⁸ (U//FOUO) 50 U.S.C. 413b(a).

^{9 (}U//FOUO) 50 U.S.C. 413b(a)(1), (5).

^{10 (}U//EQUO) 50 U.S.C. 403-1, 403-3(d)(1).

Enhanced Interrogation Techniques

- ♦ The attention grasp consists of grasping the detainee with both hands, with one hand on each side of the collar opening, in a controlled and quick motion. In the same motion as the grasp, the detainee is drawn toward the interrogator.
- During the walling technique, the detainee is pulled forward and then quickly and firmly pushed into a flexible false wall so that his shoulder blades hit the wall. His head and neck are supported with a rolled towel to prevent whiplash.
- The facial hold is used to hold the detainee's head immobile. The interrogator places an open palm on either side of the detainee's face and the interrogator's fingertips are kept well away from the detainee's eyes.
- With the facial or insult slap, the fingers are slightly spread apart. The interrogator's hand makes contact with the area between the tip of the detainee's chin and the bottom of the corresponding earlobe.
- In cramped confinement, the detainee is placed in a confined space, typically a small or large box, which is usually dark. Confinement in the smaller space lasts no more than two hours and in the larger space it can last up to 18 hours.
- ◆ Insects placed in a confinement box involve placing a harmless insect in the box with the detainee.
- During wall standing, the detainee may stand about 4 to 5 feet from a wall with his feet spread approximately to his shoulder width. His arms are stretched out in front of him and his fingers rest on the wall to support all of his body weight. The detainee is not allowed to reposition his hands or feet.
- The application of stress positions may include having the detainee sit on the floor with his legs extended straight out in front of him with his arms raised above his head or kneeling on the floor while leaning back at a 45 degree angle.
- Sleep deprivation will not exceed 11 days at a time.
- ♦ The application of the waterboard technique involves binding the detainee to a bench with his feet elevated above his head. The detainee's head is immobilized and an interrogator places a cloth over the detainee's mouth and nose while pouring water onto the cloth in a controlled manner. Airflow is restricted for 20 to 40 seconds and the technique produces the sensation of drowning and suffocation.

TOP SECRET/	(b)(1)	_
•	(b)(3) NatSecAct	

(b)(1) **DOJ LEGAL ANALYSIS** (b)(3) NatSecAct

36. (TS/ CIA's OGC sought guidance from DoJ regarding the legal bounds of EITs vis-à-vis individuals detained under the MON authorization. The ensuing legal opinions focus on the Convention Against Torture and Other Cruel, Inhumane and Degrading Treatment or Punishment (Torture Convention),¹⁵ especially as implemented in the U.S. criminal code, 18 U.S.C. 2340-2340A.

37. (U//FOUQ) The Torture Convention specifically prohibits "torture," which it defines in Article 1 as:

any act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of having committed, or intimidating or coercing him or a third person, or for any reason based on discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity. It does not include pain or suffering arising only from, inherent in or incidental to lawful sanction. [Emphasis added.]

Article 4 of the Torture Convention provides that states party to the Convention are to ensure that all acts of "torture" are offenses under their criminal laws. Article 16 additionally provides that each state party "shall undertake to prevent in any territory under its jurisdiction other acts of cruel, inhuman or degrading treatment or punishment which do not amount to acts of torture as defined in Article 1."

(b)(1)

(b)(3) NatSecAct

^{15 (}U//FOUO). Adopted 10 December 1984, S. Treaty Doc. No. 100-20 (1988) 1465 U.N.T.S. 85 (entered into force 26 June 1987). The Torture Convention entered into force for the United States on 20 November 1994.

	(b)/1)	
TOP SECRET/	(b)(1) (b)(3) N	atSecAct

38. (U//FOUO) The Torture Convention applies to the United States only in accordance with the reservations and understandings made by the United States at the time of ratification.¹⁶ As explained to the Senate by the Executive Branch prior to ratification:

Article 16 is arguably broader than existing U.S. law. The phrase "cruel, inhuman or degrading treatment or punishment" is a standard formula in international instruments and is found in the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the European Convention on Human Rights. To the extent the phrase has been interpreted in the context of those agreements, "cruel" and "inhuman" treatment or punishment appears to be roughly equivalent to the treatment or punishment barred in the United States by the Fifth, Eighth and Fourteenth Amendments. "Degrading" treatment or punishment, however, has been interpreted as potentially including treatment that would probably not be prohibited by the U.S. Constitution. [Citing a ruling that German refusal to recognize individual's gender change might be considered "degrading" treatment.] To make clear that the <u>United States construes the phrase to be</u> coextensive with its constitutional guarantees against cruel, unusual, and inhumane treatment, the following understanding is recommended:

"The United States understands the term 'cruel, inhuman or degrading treatment or punishment,' as used in Article 16 of the Convention, to mean the cruel, unusual, and inhumane treatment or punishment prohibited by the Fifth, Eighth and/or Fourteenth Amendments to the Constitution of the United States." [Emphasis added.]

^{16 (}U) Vienna Convention on the Law of Treaties, 23 May 1969, 1155 U.N.T.S. 331 (entered into force 27 January 1980). The United States is not a party to the Vienna Convention on treaties, but it generally regards its provisions as customary international law.

^{17 (}U//FOUC) S. Treaty Doc. No. 100-20, at 15-16.

TOP SECRET/	(b)(1)	NatSecAct
	(D)(3)	Nalsecaci

39. (U//FOUO) In accordance with the Convention, the United States criminalized acts of torture in 18 U.S.C. 2340A(a), which provides as follows:

Whoever outside the United States commits or attempts to commit torture shall be fined under this title or imprisoned not more than 20 years, or both, and if death results to any person from conduct prohibited by this subsection, shall be punished by death or imprisoned for any term of years or for life.

The statute adopts the Convention definition of "torture" as "an act committed by a person acting under the color of law specifically intended to inflict severe physical or mental pain or suffering (other than pain or suffering incidental to lawful sanctions) upon another person within his custody or physical control." "Severe physical pain and suffering" is not further defined, but Congress added a definition of "severe mental pain or suffering:"

[T]he prolonged mental harm caused by or resulting from-

- (A) the intentional infliction or threatened infliction of severe physical pain or suffering;
- (B) the administration or application, or threatened administration or application, of mind-altering substances or other procedures calculated to disrupt profoundly the senses or the personality;
- (C) the threat of imminent death; or
- (D) the threat that another person will imminently be subjected to death, severe physical pain or suffering, or the administration or application of mind-altering substances or other procedures calculated to disrupt profoundly the senses or personality....¹⁹

These statutory definitions are consistent with the understandings and reservations of the United States to the Torture Convention.

40. (U//FOUO) DoJ has never prosecuted a violation of the torture statute, 18 U.S.C. §2340, and there is no case law construing its provisions. OGC presented the results of its research into relevant issues under U.S. and international law to DoJ's OLC in the summer of 2002 and received a preliminary summary of the elements of the torture statute from OLC in July 2002. An unclassified 1 August 2002 OLC legal memorandum set out OLC's conclusions regarding the proper interpretation of the torture statute and concluded that "Section 2340A proscribes acts inflicting, and that are specifically intended to inflict, severe pain or suffering whether mental or physical." Also, OLC stated that the acts must be of an "extreme nature" and that "certain acts may be cruel, inhuman, or degrading, but still not produce pain and suffering of the requisite intensity to fall within Section 2340A's proscription against torture." Further describing the requisite level of intended pain, OLC stated:

Physical pain amounting to torture must be equivalent in intensity to the pain accompanying serious physical injury, such as organ failure, impairment of bodily function, or even death. For purely mental pain or suffering to amount to torture under Section 2340, it must result in significant psychological harm of significant duration, e.g., lasting for months or even years.²¹

OLC determined that a violation of Section 2340 requires that the infliction of severe pain be the defendant's "precise objective." OLC also concluded that necessity or self-defense might justify interrogation methods that would otherwise violate Section 2340A.²² The August 2002 OLC opinion did not address whether any other provisions of U.S. law are relevant to the detention, treatment, and interrogation of detainees outside the United States.²³

²⁰ (U//FOUQ) Legal Memorandum, Re: Standards of Conduct for Interrogation under 18 U.S.C. 2340-2340A (1 August 2002).

^{21 (}U//FOUO) Ibid., p. 1.

^{22 (}U//FOUO) Ibid., p. 39.

²³ (U//FOUO) OLC's analysis of the torture statute was guided in part by judicial decisions under the Torture Victims Protection Act (TVPA) 28 U.S.C. 1350, which provides a tort remedy for victims of torture. OLC noted that the courts in this context have looked at the entire course

TOP SECRET/	(b)(1)	
	——(b)(3) NatSecAct————	
	(8)(6) 144(666) (6)	

41. (U//FOUO). A second unclassified 1 August 2002 OLC opinion addressed the international law aspects of such interrogations.²⁴ This opinion concluded that interrogation methods that do not violate 18 U.S.C. 2340 would not violate the Torture Convention and would not come within the jurisdiction of the International Criminal Court.

(b)(1)

(b)(3) NatSecAct

42. (TS/ In addition to the two unclassified opinions, OLC produced another legal opinion on 1 August 2002 at the request of CIA.²⁵ (Appendix C.) This opinion, addressed to CIA's Acting General Counsel, discussed whether the proposed use of EITs in interrogating Abu Zubaydah would violate the Title 18 prohibition on torture. The opinion concluded that use of EITs on Abu Zubaydah would not violate the torture statute because, among other things, Agency personnel: (1) would not specifically intend to inflict severe pain or suffering, and (2) would not in fact inflict severe pain or suffering.

(b)(1)

(b)(3) NatSecAct

43. (TS/ This OLC opinion was based upon specific representations by CIA concerning the manner in which EITs would be applied in the interrogation of Abu Zubaydah. For example, OLC was told that the EIT "phase" would likely last "no more than several days but could last up to thirty days." The EITs would be used on "an as-needed basis" and all would not necessarily be used. Further, the EITs were expected to be used "in some sort of escalating fashion, culminating with the waterboard though not necessarily ending with this technique." Although some of the EITs

of conduct, although a single incident could constitute torture. OLC also noted that courts may be willing to find a wide range of physical pain can rise to the level of "severe pain and suffering." Ultimately, however, OLC concluded that the cases show that only acts "of an extreme nature have been redressed under the TVPA's civil remedy for torture." White House Counsel Memorandum at 22 - 27.

TOP SECRET/	(b)(1) -(b)(3) NatSecAct

might be used more than once, "that repetition will not be substantial because the techniques generally lose their effectiveness after several repetitions." With respect to the waterboard, it was explained that:

... the individual is bound securely to an inclined bench The individual's feet are generally elevated. A cloth is placed over the forehead and eyes. Water is then applied to the cloth in a controlled manner. As this is done, the cloth is lowered until it covers both the nose and mouth. Once the cloth is saturated and completely covers the mouth and nose, the air flow is slightly restricted for 20 to 40 seconds due to the presence of the cloth. This causes an increase in carbon dioxide level in the individual's blood. This increase in the carbon dioxide level stimulates increased effort to breathe. This effort plus the cloth produces the perception of "suffocation and incipient panic," i.e., the perception of drowning. The individual does not breathe water into his lungs. During those 20 to 40 seconds, water is continuously applied from a height of [12] to 24] inches. After this period, the cloth is lifted, and the individual is allowed to breathe unimpeded for three or four full breaths. The sensation of drowning is immediately relieved by the removal of the cloth. The procedure may then be repeated. The water is usually applied from a canteen cup or small watering can with a spout. . . . [T]his procedure triggers an automatic physiological sensation of drowning that the individual cannot control even though he may be aware that he is in fact not drowning. [I]t is likely that this procedure would not last more than 20 minutes in any one application.

Finally, the Agency presented OLC with a psychological profile of Abu Zubaydah and with the conclusions of officials and psychologists associated with the SERE program that the use of EITs would cause no long term mental harm. OLC relied on these representations to support its conclusion that no physical harm or prolonged mental harm would result from the use on him of the EITs, including the waterboard.²⁶

(b)(3) NatSecAct

According to the Chief, Medical Services, OMS was neither consulted nor involved in the initial analysis of the risk and benefits of EITs, nor provided with the OTS report cited in the OLC opinion. In retrospect, based on the OLC extracts of the OTS report, OMS contends that the reported sophistication of the preliminary EIT review was exaggerated, at least as it related to the waterboard, and that the power of this EIT was appreciably overstated in the report. Furthermore, OMS contends that the expertise of the SERE psychologist/interrogators on

(b)(1)
(b)(3) NatSecAct
(b)(3) NatSecAct

44. (TS. OGC continued to consult with DoI as the CTC Interrogation Program and the use of EITs expanded beyond the interrogation of Abu Zubaydah. This resulted in the production of an undated and unsigned document entitled, "Legal Principles Applicable to CIA Detention and Interrogation of Captured Al-Qa'ida Personnel."27 According to OGC, this analysis was fully coordinated with and drafted in substantial part by OLC. In addition to reaffirming the previous conclusions regarding the torture statute, the analysis concludes that the federal War Crimes statute, 18 U.S.C. 2441, does not apply to Al-Qa'ida because members of that group are not entitled to prisoner of war status. The analysis adds that "the [Torture] Convention permits the use of [cruel, inhuman, or degrading treatment] in exigent circumstances, such as a national emergency or war." It also states that the interrogation of Al-Qa'ida members does not violate the Fifth and Fourteenth Amendments because those provisions do not apply extraterritorially, nor does it violate the Eighth Amendment because it only applies to persons upon whom criminal sanctions have been imposed. Finally, the analysis states that a wide range of EITs and other techniques would not constitute conduct of the type that would be prohibited by the Fifth, Eighth, or Fourteenth Amendments even were they to be applicable:

The use of the following techniques and of comparable, approved techniques does not violate any Federal statute or other law, where the CIA interrogators do not specifically intend to cause the detainee to undergo severe physical or mental pain or suffering (i.e., they act with the good faith belief that their conduct will not cause such pain or suffering): isolation, reduced caloric intake (so long as the amount is calculated to maintain the general health of the detainees), deprivation of reading material, loud music or white

the waterboard was probably misrepresented at the time, as the SERE waterboard experience is so different from the subsequent Agency usage as to make it almost irrelevant. Consequently, according to OMS, there was no a priori reason to believe that applying the waterboard with the frequency and intensity with which it was used by the psychologist/interrogators was either efficacious or medically safe.

noise (at a decibel level calculated to avoid damage to the detainees' hearing), the attention grasp, walling, the facial hold, the facial slap (insult slap), the abdominal slap, cramped confinement, wall standing, stress positions, sleep deprivation, the use of diapers, the use of harmless insects, and the water board.

According to OGC, this analysis embodies DoJ agreement that the reasoning of the classified 1 August 2002 OLC opinion extends beyond the interrogation of Abu Zubaydah and the conditions that were specified in that opinion.

NOTICE TO AND CONSULTATION WITH EXECUTIVE AND CONGRESSIONAL **OFFICIALS** (b)(1)(b)(3) NatSecAct 45. (TS/ At the same time that OLC was reviewing the legality of EITs in the summer of 2002, the Agency was consulting with NSC policy staff and senior Administration officials. The DCI briefed appropriate senior national security and legal officials on the proposed EITs. In the fall of 2002, the Agency briefed the leadership of the Congressional Intelligence Oversight Committees on the use of both standard techniques and EITs. (b)(1)(b)(3) NatSecAct 46. (TS/ In early 2003, CIA officials, at the urging of the General Counsel, continued to inform senior Administration officials and the leadership of the Congressional Oversight Committees of the then-current status of the CTC Program. The Agency specifically wanted to ensure that these officials and the Committees continued to be aware of and approve CIA's actions. The General Counsel recalls that he spoke and met with White House Counsel and others at the NSC, as well as DoJ's Criminal Division and Office of Legal Counsel beginning in December 2002 and briefed them on the scope and breadth of the CTC's Detention and Interrogation Program. Techniques."33 EITs require advance approval from Headquarters, as do standard techniques whenever feasible. The field must document the use of both standard techniques and EITs.

(b)(3) NatSecAct

(b)(1)

63. (TS/ The DCI Interrogation Guidelines define "standard interrogation techniques" as techniques that do not incorporate significant physical or psychological pressure. These techniques include, but are not limited to, all lawful forms of questioning employed by U.S. law enforcement and military interrogation personnel. Among standard interrogation techniques are the use of isolation, sleep deprivation not to exceed 72 hours,34 reduced caloric intake (so long as the amount is calculated to maintain the general health of the detainee), deprivation of reading material, use of loud music or white noise (at a decibel level calculated to avoid damage to the detainee's hearing), the use of diapers for limited periods (generally not to exceed 72 hours, or during transportation where appropriate), and moderate psychological pressure. The DCI Interrogation Guidelines do not specifically prohibit improvised actions. A CTC/Legal officer has said, however, that no one may employ any technique outside specifically identified standard techniques without Headquarters approval.

(b)(1) appr (b)(3) NatSecAct

64. (TS/ EITs include physical actions and are defined as "techniques that do incorporate physical or psychological pressure beyond Standard Techniques." Headquarters must approve the use of each specific EIT in advance. EITs may be employed only by trained and certified interrogators for use with a specific detainee and with appropriate medical and psychological monitoring of the process.³⁵

(b)(1) Medical Guidelines(b)(3) NatSecAct

OMS prepared draft guidelines for 65. (TS) medical and psychological support to detainee interrogations. The Chief, Medical Services disseminated the undated OMS draft guidelines in April 2003 to OMS personnel assigned to detention facilities. According to OMS, these guidelines were a compilation of previously issued guidance that had been disseminated in a piecemeal fashion. The guidelines were marked "draft" based on the advice of CTC/Legal. These guidelines quote excerpts from the DCI Interrogation Guidelines. They include a list of sanctioned interrogation techniques, approval procedures, technique goals, and staff requirements. The OMS draft guidelines also expand upon the practical medical implications of the DCI Interrogation Guidelines, addressing: general evaluation, medical treatment, uncomfortably cool environments, white noise or loud music, shackling, sleep deprivation, cramped confinement (confinement boxes), and the waterboard. According to the Chief, Medical Services, the OMS Guidelines were intended solely as a reference for the OMS personnel directly supporting the use of EITs and were not intended to be Agency authorizations for the techniques discussed. OMS most recently updated these draft guidelines in September 2003, and, according to the Chief, Medical Services, they were disseminated to all OMS field personnel involved in the Detention and Interrogation Program. (Appendix F.)

number of psychologists, physicians, Physician's Assistants, 39 and COBs completed the training for familiarization purposes. Students completing the Interrogation Course are required to sign an acknowledgment that they have read, understand, and will comply with the DCI's Interrogation Guidelines. (b)(3) NatSecAct

69. (TS/ In June 2003, CTC established a debriefing course for Agency substantive experts who are involved in questioning detainees after they have undergone interrogation and have been deemed "compliant." The debriefing course was established to train non-interrogators to collect actionable intelligence from high value detainees in CIA custody. The course is intended to familiarize non-interrogators with key aspects of the Agency interrogation Program, to include the Program's goals and legal authorities, the DCI Interrogation Guidelines, and the roles and responsibilities of all who interact with a high value detainee. As of September 2003, three of these training sessions had been conducted, with a total of individuals completing the training. CTC/RDG was contemplating establishing a similar training regimen for Security Protective Officers (b)(3) NatSecAct and linguists who will be assigned to interrogation sites.

psychologist/interrogators began Al-Nashiri's interrogation using EITs immediately upon his arrival. Al-Nashiri provided lead information on other terrorists during his first day of interrogation. On the twelfth day of interrogation, the two psychologist/ interrogators administered two applications of the waterboard to Al-Nashiri during two separate interrogation sessions. Enhanced interrogation of Al-Nashiri continued through 4 December 2002

(b)(1)

(b)(3) NatSecAct (b)(3) NatSecAct ideotapes of Interrogations *77. (*TS/ Headquarters had intense interest in (b)(3) NatSecAct land aspects of Abu Zubaydah's interrogation including compliance with the guidance provided to the site relative to the use of EITs. Apart from this, however, and before the use of EITs, the interrogation teams at (b)(1)(b)(3) NatSecActleotape the interrogation sessions. One initial purpose was to ensure a record of Abu Zubaydah's medical condition and treatment should he succumb to his wounds and questions arise about the medical care provided to him by CIA. Another purpose was to assist in the preparation of the debriefing reports, although the team advised CTC/Legal that they rarely, if ever, were used for that purpose. There are 92 videotapes, 12 of which include EIT applications. An OGC attorney reviewed the videotapes in November and December 2002 to ascertain compliance with the August 2002 DoJ opinion and compare what actually happened with what was reported to Headquarters. He reported that there was no deviation from the DoJ guidance or the written record. (b)(1)(b)(3) NatSecAct 78. (TS./ OIG reviewed the videotapes, logs, and in May 2003. OIG identified 83 waterboard cables applications, most of which lasted less than 10 seconds. 41 OIG also identified one instance where a psychologist/interrogator verbally (b)(1)(b)(3) NatSecAct For the purpose of this Review, a waterboard application constituted each

discrete instance in which water was applied for any period of time during a session.

threatened Aby Zubaydah by stating, "If one child dies in America,

and I find out you knew something about it, I will personally cut your mother's throat."42 OIG found 11 interrogation videotapes to be blank. Two others were blank except for one or two minutes of (b)(1)(b)(3) NatSecAct recording. Two others were broken and could not be reviewed. OIG compared the videotapes to logs and cables and identified a 21-hour period of time, which included two waterboard sessions, that was not captured on the videotapes. (b)(1)(b)(3) NatSecAct 79. (TS/ OIG's review of the videotapes revealed that the waterboard technique employed at was different from the technique as described in the DoJ opinion and used in the SERE training. The difference was in the manner in which the detainee's breathing was obstructed. At the SERE School and in the DoJ opinion, the subject's airflow is disrupted by the firm application of a damp cloth over the air passages; the interrogator applies a small (b)(1) amount of water to the cloth in a controlled manner. By contrast, the (b)(3) NatSecAct continuously applied large volumes Agency interrogator of water to a cloth that covered the detainee's mouth and nose. One of the psychologists/interrogators acknowledged that the Agency's use of the technique differed from that used in SERE training and explained that the Agency's technique is different because it is "for real" and is more poignant and convincing. (b)(1)(b)(3) NatSecAct (b)(1)80. (TS/ From December 2002 until (b)(3) NatSecAct-September 2003, was used to detain and interrogate eight individuals. (b)(1)(b)(3) NatSecAct During this time, Headquarters issued the formal DCI Confinement Guidelines, the DCI Interrogation Guidelines, and the additional draft guidelines specifically

General acknowledged he is fully aware of the repetitive use of the waterboard and that CIA is well within the scope of the DoJ opinion and the authority given to CIA by that opinion. The Attorney General was informed the waterboard had been used 119 times on a single individual.

(b)(1) \$ (b)(3) NotSocAc

(b)(3) NatSecAct

100. (TS. Cables indicate that Agency interrogators applied the waterboard technique to Khalid Shaykh Muhammad 183 times during 15 sessions over a period of 14 days. The application of this technique to Khalid Shaykh Muhammad evolved because of this detainee's ability to counter the technique by moving his lips to the side to breathe while water was being poured. To compensate, the interrogator administering the waterboard technique reportedly held Khalid Shaykh Muhammad's lips with one hand while pouring water with the other. Khalid Shaykh Muhammad also countered the technique by holding his breath and drinking as much of the water being administered as he could. An on-site physician monitoring the waterboard sessions estimated that Khalid Shaykh Muhammad was capable of ingesting up to two liters of water. Cables indicate that an average of 19 liters (5 gallons) of water were used per waterboard session, with some of the water being splashed onto Khalid Shaykh Muhammad's chest and abdomen to evoke a visceral response from him. On the advice of the presiding physician, water was replaced with normal saline to prevent water intoxication and dilution of electrolytes. In addition, one of the interrogators reportedly formed his hands over Khalid Shaykh Muhammad's mouth to collect approximately one inch of standing water.⁴⁷ Cables reflect that, during six waterboard

b)(1)	(b)(3) CIAAc

	(b)(7)(c)

According to the while Khalid Shaykh Muhammad proved to be remarkably resilient to waterboard applications, the "unprecedented intensity of its use" led OMS to advise CTC/SMD that OMS considered the ongoing process "both excessive and pointless." This concern was the impetus for OMS to juxtapose explicitly the SERE waterboard experience with that of the Agency's in the OMS Guidelines then being assembled.

died from hypothermia.⁵¹ This was increased to 40 to 60 heaters after the death. (b)(1)(b)(1)(b)(3) NatSecAct (b)(3) NatSecAct 116. (TS/ had no written standard operating procedures until January 2003 when the DCI Confinement Guidelines were issued. A psychologist/interrogator visiting the facility before Gul Rahman's death in November 2002 noted this deficiency, stating that the procedures should be so detailed as to specify who is responsible for turning the lights on and off, or what the temperature should be in the facility. Although the (b)(3) NatSecAct psychologist/interrogator relayed this opinion to the Manager and planned to author procedures, before he could do so, he (b)(1)for the interrogation of a high value detainee. was sent to (b)(3) NatSecAct The customary practice at 117. (TS/ was to shave each detainee's head and beard and conduct a medical examination upon arrival. Detainees were then given uniforms and moved to a cell. All detainees were subjected to total darkness and loud music. Photographs were taken of each detainee for identification purposes. While in the cells, detainees were shackled to the wall. The guards fed the detainees on an alternating schedule of one meal on one day and two meals the next day. As the temperature decreased in November and December 2002, the Site Manager made efforts to acquire additional supplies, such as warmer uniforms, blankets, and heaters.52 If a detainee was cooperative, he

was afforded improvements in his environment to include a mat, blankets, a Koran, a lamp, and additional food choices. Detainees who were not cooperative were subjected to austere conditions and

aggressive interrogations until they became "compliant."

	TOP SECRET (b)(1) (b)(3) NatSecAct
	(b)(1) (b)(3) NatSecAct
(b)(1) (b)(3) NatSec	cAct Death of Gul Rahman
!	159. (TS/ Gul Rahman, a suspected Afghan
(b)(1)	extremist associated with the Hezbi Islami Gulbuddin organization,
(b)(3) NatSecAct	was captured in on and rendered to
	on November 2002. Between November 2002,
	Rahman underwent at least six interrogation sessions conducted by
(b)(1)	various members of a team that included the
(b)(3) NatSecAd	ct
(b)(6) (b)(7)(c)	
	was experienced from decades of work in
	the SERE program, had helped develop the EITs, and had conducted
•	interrogations at had
(b)(1)	no experience or relevant training in interrogations before their
(b)(6)	but had acquired approximately six
(b)(7)(c)	months of experience through on-the-job training. (b)(1) (b)(3) NatSecAct
	160. (TS) Rahman was subjected to sleep
	deprivation sessions of up to 48 hours, at least one cold shower, and a
(b)(1)	"hard takedown"—euphemistically termed "rough treatment."66 In
	etaddition, Rahman was apparently without clothing for much of his
	as part of the sleep deprivation and to cause cultural
	humiliation. Despite these measures, Rahman remained
	uncooperative and provided no intelligence. His only concession
	was to admit his identity on November 2002; otherwise, he
(b)(1)	retained his resistance posture and demeanor. The November
(b)(3) NatSecAc	cable reporting that Rahman admitted his identity to
	officers herades the following, Tariman spent the days since
	his last session in cold conditions with minimal food and sleep." A
	(b)(1)
	(b)(3) NatSecAct
	66 (3) Both the cold shower and hard takedown are described in greater detail later in this Review.

67

(b)(1) (b)(3) N atS	TOP SECRET/ (b)(1) (b)(3) NatSecAct	
,	psychological assessment of Rahman on November 2002 noted his remarkable physical and psychological resilience and recommended,	
(b)(1) (b)(3) N atSe	in part, "continued environmental deprivations." SecAct	
(-,(-,-,	161. (TS/) On the afternoon of November 2002,	
	when delivered food to Rahman, he reportedly	
	threw the food, his water bottle, and defecation bucket at the guards.	
	In addition, he reportedly threatened the guards and told them he	•
	had seen their faces and would kill them upon his release. When the	
	Site Manager learned of this incident, he authorized short-chaining,	
	i.e., Rahman's hands and feet were shackled and connected with a	
	short-chain. (b)(1)	
	162. (TS/ (b)(3) NatSecAct found Rahman dead	
(b)(1)	in his call on the morning of November 2002. The ambient	
(b)(3) NatSe	temperature was recorded at a low of degrees. Rahman was still	
,	in the short-chain position that required him to sit, naked from the	
	waist down, on the concrete floor of his cell. He wore only a	
	sweatshirt. (b)(1)	
(b)(3) NatSe	ecAct (b)(3) NatSecAct	
	163. (TS/ reported Rahman's death	
	that day in an cable to the DDO. The DDO dispatched	
	the DO Investigative Team, (b)(1) (b)(3) NatSecAct	
	CIA also promptly reported the incident to SSCI	
	and HPSCI. The DO Investigative Team conducted interviews and	
•	the pathologist performed an autopsy of Rahman. The autopsy	4-5
	indicated, by a diagnosis of exclusion, that death was caused by	
· ·	hypothermia.67 After the DO investigation was completed, CIA	
	reported the death to DoJ and further briefed the SSCI and HPSCI	
	leadership. OIG opened an investigation into the circumstances	
	surrounding this incident. DoJ declined prosecution of the Agency	
	employee responsible for OIG's investigation will be the	
•	subject of a separate Report of Investigation. (b)(1) (b)(3) NatSecAct	
	67 (S)-The pathologist estimated Rahman to be in his mid-30s.

the four days the individual was detained, an Agency independent contractor, who was a paramilitary officer, is alleged to have severely beaten the detainee with a large metal flashlight and kicked him during interrogation sessions. The detainee died in custody on 21 June; his body was turned over to a local cleric and returned to his family on the following date without an autopsy being performed. Neither the contractor nor his Agency staff supervisor had been trained or authorized to conduct interrogations. The Agency did not renew the independent contractor's contract, which was up for renewal soon after the incident. OIG is investigating this incident in concert with DoJ.⁷⁷

to assess one detainee's level of compliance was articulated in a December 2002 cable requesting interrogators to further press Al-Nashiri for actionable threat information:

(b)(1)

(b)(3) NatSecAct

... it is inconceivable to us that Nashiri cannot provide us concrete leads to locate and detain the active terrorists in his network who are still at large. . . .

From our optic, the single best measure of this cooperation will be in his reporting. Specifically, when we are able to capture other terrorists based on his leads and to thwart future plots based on his reporting, we will have much more confidence that he is, indeed, genuinely cooperative on some level.

(b)(1)TOPCECRET (b)(3) NatSecAct Approved for Release: 2016/06/10 C05856717

Base recommends against resuming enhanced measures with Subj[ect] unless there are specific pieces of information he has provided that we are certain/certain are lies or omissions; or there is equally reliable additional information from other sources which implicates subj[ect] in a heretofore unknown plot to attack U.S. or allied interests. If such is the case, Base would eagerly support returning to all enhanced measures; indeed, we would be the first to request them. Without tangible proof of lying or intentional withholding, however, we believe employing enhanced measures will accomplish nothing except show subj[ect] that he will be punished whether he cooperates or not, thus eroding any remaining desire to continue cooperating. . . .

Bottom line is we think subj[ect] is being cooperative, and if subjected to indiscriminate and prolonged enhanced measures, there is a good chance he will either fold up and cease cooperating, or suffer the sort of permanent mental harm prohibited by the statute. Therefore, a decision to resume enhanced measures must be grounded in fact and not general feelings that subj[ect] is not being forthcoming

generated substantial pressure from Headquarters to continue use of the EITs. According to this senior officer, the decision to resume use of the waterboard on Abu Zubaydah was made by senior officers of (b)(3) NatSecAct the DO. A team of senior CTC officers traveled from Headquarters to (b)(1)to assess Abu Zubaydah's compliance and witnessed the final waterboard session, after which, they reported back to Headquarters that the EITs were no longer needed on Abu Zubaydah. (b)(1)(b)(3) NatSecAct 210. (TS/ told OIG that (b)(6)"risk" for CTC/UBL is very different from the "risk" perceived by (b)(7)(c)(b)(7)(d)CTC/RDG and the interrogators. Specifically, for CTC/UBL, risk is associated with not obtaining the actionable information needed to prevent "the next big attack," hence analysts are reluctant to agree that a detainee is not employing resistance techniques. On the other hand, risk for CTC/RDG is associated with the continued use of EITs, which could possibly lead, directly or indirectly, to a detainee's death or cause him permanent harm. (b)(1)**EFFECTIVENESS** (b)(3) NatSecAct 211. (TS/) The detention of terrorists has prevented them from engaging in further terrorist activity, and their interrogation has provided intelligence that has enabled the identification and apprehension of other terrorists, warned of terrorists plots planned for the United States and around the world, and supported articles frequently used in the finished intelligence publications for senior policymakers and war fighters. In this regard, there is no doubt that the Program has been effective. Measuring the effectiveness of EITs, however, is a more subjective process and not (b)(1) without some concern. (b)(3) NatSecAct 212. (TS/ When the Agency began capturing terrorists, management judged the success of the effort to be getting them off the streets, (b)(3) NatSecAct

and sources of funding for

Al-Qa'ida. Perhaps the most significant information about Al-Qa'ida obtained from detainees is on the subject of the group's planned use of weapons of mass destruction (WMD) in the United States. Analysts had long suspected Al-Qa'ida was attempting to develop a WMD capability, and information from Abu Zubaydah and Ibn al-Ahaykh al-Libi (a.k.a. Zubayr) hinted at such efforts. It was the information from Khalid Shaykh Muhammad, however, that confirmed the analysts' suspicions. In addition to information on anthrax; chemical, biological, radiological, and nuclear programs; and training in the use of poisons and explosives, Khalid Shaykh Muhammad provided information that has led to the capture of individuals who headed the programs to develop WMD capabilities, including Sayed Al-Barq who was the head of Al-Qa'ida's anthrax

(b)(1) program. (b)(3) NatSecAct

(b)(3) NatSecAct

216. (TS/ Detainee information has assisted in the identification of terrorists. For example, information from Abu Zubaydah helped lead to the identification of Jose Padilla and Binyam Muhammed—operatives who had plans to detonate a uranium-topped dirty bomb in either Washington, D.C., or New York City. Riduan "Hambali" Isomuddin provided information that led to the arrest of previously unknown members of an Al-Qa'ida cell in Karachi. They were designated as pilots for an aircraft attack inside the United States. Many other detainees, including lower-level detainees such as Zubayr and Majid Khan, have provided leads to other terrorists, but probably the most prolific has been Khalid Shaykh Muhammad. He provided information that helped lead to the arrests of terrorists including Sayfullah Paracha and his son Uzair Paracha, businessmen whom Khalid Shaykh Muhammad planned to use to smuggle explosives into the United States; Saleh Almari, a sleeper operative in New York; and Majid Khan, an operative who could enter the United States easily and was tasked to research attacks against U.S. water reservoirs. Khalid Shaykh Muhammad's information also led to the investigation and prosecution of lyman Faris, the truck driver arrested in early 2003 in Ohio. Although not

219. (TS/ senior officers familiar with the dissemination of reporting from detainee interrogations voiced concerns about compartmentation. In particular, those concerns regarded the impact on the timeliness of disseminating intelligence to analysts in CIA and to the FBI while the initial operational recipients of the information are separating out the intelligence from more (b)(3) NatSecActensitive operational information. senior officers

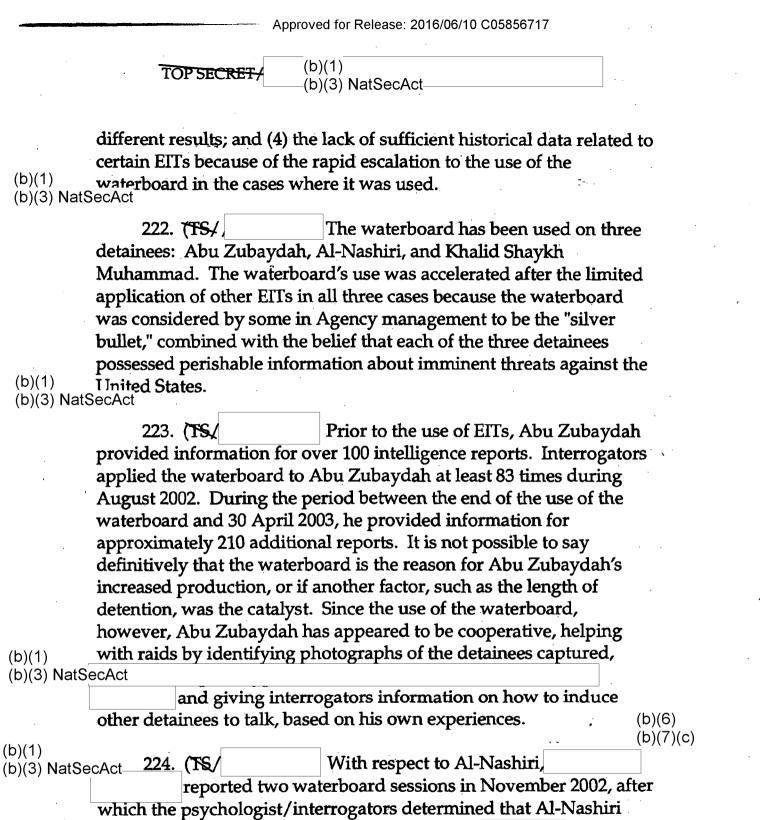

who voiced these concerns indicated that the issue was being reviewed by analysts to more precisely assess the impact of the problem.

(b)(1)(b)(3) NatSecAct

> 220. (TS) Inasmuch as EITs have been used only since August 2002, and they have not all been used with every high value detainee, there is limited data on which to assess their individual effectiveness. This Review identified concerns about the use of the waterboard, specifically whether the risks of its use were justified by the results, whether it has been unnecessarily used in some instances, and whether the fact that it is being applied in a manner different from its use in SERE training brings into question the continued applicability of the DoJ opinion to its use. Although the waterboard is the most intrusive of the EITs, the fact that precautions have been taken to provide on-site medical oversight in the use of all EITs is evidence that their use poses risks.

(b)(1)(b)(3) NatSecAct

> 221. (TS) Determining the effectiveness of each EIT is important in facilitating Agency management's decision as to which techniques should be used and for how long. Measuring the overall effectiveness of EITs is challenging for a number of reasons including: (1) the Agency cannot determine with any certainty the totality of the intelligence the detainee actually possesses; (2) each detainee has different fears of and tolerance for EITs; (3) the application of the same EITs by different interrogators may have

(b)(1)

(b)(1)

(b)(1)

was compliant. However, after being moved to where a (b)(1)(b)(3) NatSecAct ferent interrogation team assumed responsibility for his interrogations, Al-Nashiri was thought to be withholding information. Al-Nashiri subsequently received additional EITs, including stress positions, but not the waterboard. The Agency then determined Al-Nashiri to be "compliant." Because of the litany of

TOT DECREE	(b)(3)	NatSecAct

techniques used by different interrogators over a relatively short period of time, it is difficult to identify exactly why Al-Nashiri became more willing to provide information. However, following the use of EITs, he provided information about his most current operational planning and the Saudi Al-Qa'ida network, as opposed to the historical information he provided before the use of EITs.

(b)(1) (b)(3) NatSecAct

225. (TS/ On the other hand, Khalid Shaykh Muhammad, an accomplished resistor, provided only a few intelligence reports prior to the use of the waterboard, and analysis of that information revealed that much of it was outdated, inaccurate, or incomplete. As a means of less active resistance, at the beginning of their interrogation, detainees routinely provide information that they know is already known. Khalid Shaykh Muhammad received 183 applications of the waterboard in March 2003 and remained resilient, providing limited useful intelligence, until the application of sleep deprivation for a period of 180 hours. Although debriefers still must ask the right questions to get answers from Khalid Shaykh Muhammad, since the employment of sleep deprivation, intelligence production from his debriefings totaled over 140 reports as of 30 April 2003. In Khalid Shaykh Muhammad's case, the waterboard was determined to be of limited effectiveness. One could conclude that sleep deprivation was effective in this case, but a definitive conclusion is hard to reach considering that the lengthy sleep deprivation followed extensive use of the waterboard.

POLICY CONSIDERATIONS AND CONCERNS REGARDING THE DETENTION (b)(1) AND INTERROGATION PROGRAM (b)(3) NatSecAct

226. (TS/ The EITs used by the Agency under the CTC Program are inconsistent with the public policy positions that the United States has taken regarding human rights. This divergence has been a cause of concern to some Agency personnel involved with the Program.

TOP SECRET!	(b)(1) (b)(3)	NatSecAct

Policy Considerations

227. (U//FOUO) Throughout its history, the United States has been an international proponent of human rights and has voiced opposition to torture and mistreatment of prisoners by foreign countries. This position is based upon fundamental principles that are deeply embedded in the American legal structure and jurisprudence. The Fifth and Fourteenth Amendments to the U.S. Constitution, for example, require due process of law, while the Eighth Amendment bars "cruel and unusual punishments."

228. (U//FOUQ). The President advised the Senate when submitting the Torture Convention for ratification that the United States would construe the requirement of Article 16 of the Convention to "undertake to prevent in any territory under its jurisdiction other acts of cruel, inhuman, or degrading treatment or punishment which do not amount to torture" as "roughly equivalent to" and "coextensive with the Constitutional guarantees against cruel, unusual, and inhumane treatment."81 To this end, the United States submitted a reservation to the Torture Convention stating that the United States considers itself bound by Article 16 "only insofar as the term 'cruel, inhuman or degrading treatment or punishment' means the cruel, unusual, and inhumane treatment or punishment prohibited by the 5th, 8th and/or 14th Amendments to the Constitution of the United States." Although the Torture Convention expressly provides that no exceptional circumstances whatsoever, including war or any other public emergency, and no order from a superior officer, justifies torture, no similar provision was included regarding acts of "cruel, inhuman or degrading treatment or punishment."

^{81 (}U//FOUO). See Message from the President of the United States Transmitting the Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment, Sen. Treaty Doc. 100-20, 100th Cong., 2d Sess., at 15, May 23, 1988; Senate Committee on Foreign Relations, Executive Report 101-30, August 30, 1990, at 25, 29, quoting summary and analysis submitted by President Ronald Reagan, as revised by President George H.W. Bush.

TOP SECRET/	(b)(1)	
	(b)(3) NatSecAct	*

229. (U//FOUO) Annual U.S. State Department Country Reports on Human Rights Practices have repeatedly condemned harsh interrogation techniques utilized by foreign governments. For example, the 2002 Report, issued in March 2003, stated:

[The United States] have been given greater opportunity to make good on our commitment to uphold standards of human dignity and liberty [N]o country is exempt from scrutiny, and all countries benefit from constant striving to identify their weaknesses and improve their performance [T]he Reports serve as a gauge for our international human rights efforts, pointing to areas of progress and drawing our attention to new and continuing challenges.

In a world marching toward democracy and respect for human rights, the United States is a leader, a partner and a contributor. We have taken this responsibility with a deep and abiding belief that human rights are universal. They are not grounded exclusively in American or western values. But their protection worldwide serves a core U.S. national interest.

The State Department Report identified objectionable practices in a variety of countries including, for example, patterns of abuse of prisoners in Saudi Arabia by such means as "suspension from bars by handcuffs, and threats against family members, . . . [being] forced constantly to lie on hard floors [and] deprived of sleep " Other reports have criticized hooding and stripping prisoners naked.

230. (U//FOUQ) In June 2003, President Bush issued a statement in observance of "United Nations International Day in Support of Victims of Torture." The statement said in part:

The United States declares its strong solidarity with torture victims across the world. Torture anywhere is an affront to human dignity everywhere. We are committed to building a world where human rights are respected and protected by the rule of law.

93 (b)(1) (b)(3) NatSecAct Approved for Release: 2016/06/10 C05856717

TOP SECRET/	(b)(1) (b)(3)	NatSecAct———————————————————————————————————

Freedom from torture is an inalienable human right Yet torture continues to be practiced around the world by rogue regimes whose cruel methods match their determination to crush the human spirit

Notorious human rights abusers . . . have sought to shield their abuses from the eyes of the world by staging elaborate deceptions and denying access to international human rights monitors

The United States is committed to the worldwide elimination of torture and we are leading this fight by example. I call on all governments to join with the United States and the community of law-abiding nations in prohibiting, investigating, and prosecuting all acts of torture and in undertaking to prevent other cruel and unusual punishment

	(b)(1) (b)(3) NatSecAct
(b)(1) (b)(3) NatSecAct	t
	248. (TS/ Senior U.S. Government and Agency officials have yet to determine if third parties, such as the ICRC, will eventually have access to individuals whose detention has been disclosed. Such is the case of Ibn Sheikh al-Libi, whom the U.S. military declared to the ICRC before the military transferred him to CIA control. According to the General Counsel, Al-Libi was not subjected to any of the interrogation techniques discussed in this Review. According to senior Agency officers, the Agency is loath to send CIA detainees who have been exposed to EITs or to other sensitive information, as in the case of al-Libi, to detention facilities where they would be available to the ICRC. According to the DCI, the CTC
	Interrogation Program will continue to exist as long as the Agency continues to elicit information from detainees. He added that, in the
	near future, he sees no change from the current system.

aa

(b)(1) (b)(3) NatSecAct

(b)(1)

Agency components and individuals invested immense time and effort to implement the CTC Program quickly, effectively, and within the law. The work of the Directorate of Operations, Counterterrorist Center (CTC), Office of General Counsel (OGC), Office of Medical Services (OMS), Office of Technical Service (OTS), and the Office of Security has been especially notable. In effect, they began with almost no foundation, as the Agency had discontinued virtually all involvement in interrogations after encountering difficult issues with earlier interrogation programs in Central America and the Near East. Inevitably, there also have been some problems with current activities.

252. (57/NE) OGC worked closely with DoJ to determine the legality of the measures that came to be known as enhanced interrogation techniques (EITs). OGC also consulted with White House and National Security Council officials regarding the proposed techniques. Those efforts and the resulting DoJ legal opinion of 1 August 2002 are well documented. That legal opinion was based, in substantial part, on OTS analysis and the experience and expertise of non-Agency personnel and academics concerning whether long-term psychological effects would result from use of the proposed techniques.

> (b)(1) THE CHET (b)(3) NatSecAct Approved for Release: 2016/06/10 C05856717

TOP SECRET	(b)(1)	
_	(b)(3)	NatSecAct——————

253. (S//NE). The DoJ legal opinion upon which the Agency relies is based upon technical definitions of "severe" treatment and the "intent" of the interrogators, and consists of finely detailed analysis to buttress the conclusion that Agency officers properly carrying out EITs would not violate the Torture Convention's prohibition of torture, nor would they be subject to criminal prosecution under the U.S. torture statute. The opinion does not address the separate question of whether the application of standard or enhanced techniques by Agency officers is consistent with the undertaking, accepted conditionally by the United States regarding Article 16 of the Torture Convention, to prevent "cruel, inhuman or degrading treatment or punishment."

(b)(1) (b)(3) NatSecAct

254. (FS/ Periodic efforts by the Agency to elicit reaffirmation of Administration policy and DoJ legal backing for the Agency's use of EITs—as they have actually been employed—have been well advised and successful. However, in this process, Agency officials have neither sought nor been provided a written statement of policy or a formal signed update of the DoJ legal opinion, including such important determinations as the meaning and applicability of Article 16 of the Torture Convention. In July 2003, the DCI and the General Counsel briefed senior Administration officials on the Agency's expanded use of EITs. At that time, the Attorney General affirmed that the Agency's conduct remained well within the (b)(3) NatSecAct scope of the 1 August 2002 DoJ legal opinion.

255. YFS/ A number of Agency officers of various grade levels who are involved with detention and interrogation activities are concerned that they may at some future date be vulnerable to legal action in the United States or abroad and that the U.S. Government will not stand behind them. Although the current detention and interrogation Program has been subject to DoJ legal review and Administration political approval, it diverges sharply from previous Agency policy and practice, rules that govern interrogations by U.S. military and law enforcement officers, statements of U.S. policy by the Department of State, and public

its advice was based upon certain facts that the Agency had submitted to DoJ, observing, for example, that "... you (the Agency) have also orally informed us that although some of these techniques may be used with more than once [sic], that repetition will not be substantial because the techniques generally lose their effectiveness after several repetitions." One key Al-Qa'ida terrorist was subjected to the waterboard at least 183 times at 15 waterboard sessions during a two-week period and was denied sleep for a period of 180 hours. In this and another instance, the technique of application and volume of water used differed from the DoJ opinion.

U.S. Department of Justice

Office of Legal Counsel

Office of the Assistant Attorney General

Washington, D.C. 20530

August 1, 2002

• Memorandum for John Rizzo Acting General Counsel of the Central Intelligence Agency

Interrogation of al Qaeda Operative

You have asked for this Office's views on whether certain proposed conduct would violate the prohibition against torture found at Section 2340A of title 18 of the United States Code. You have asked for this advice in the course of conducting interrogations of Abu Zubaydah. As we understand it, Zubaydah is one of the highest ranking members of the al Qaeda terrorist organization, with which the United States is currently engaged in an international armed conflict following the attacks on the World Trade Center and the Pentagon on September 11, 2001. This letter memorializes our previous oral advice, given on July 24, 2002 and July 26, 2002, that the proposed conduct would not violate this prohibition.

I.

Our advice is based upon the following facts, which you have provided to us. We also understand that you do not have any facts in your possession contrary to the facts outlined here, and this opinion is limited to these facts. If these facts were to change, this advice would not necessarily apply. Zubaydah is currently being held by the United States. The interrogation team is certain that he has additional information that he refuses to divulge. Specifically, he is withholding information regarding terrorist networks in the United States or in Saudi Arabia and information regarding plans to conduct attacks within the United States or against our interests overseas. Zubaydah has become accustomed to a certain level of treatment and displays no signs of willingness to disclose further information. Moreover, your intelligence indicates that there is currently a level of "chatter" equal to that which preceded the September 11 attacks. In light of the information you believe Zubaydah has and the high level of threat you believe now exists, you wish to move the interrogations into what you have described as an "increased pressure phase."

As part of this increased pressure phase, Zubaydah will have contact only with a new interrogation specialist, whom he has not met previously, and the Survival, Evasion, Resistance, Escape ("SERE") training psychologist who has been involved with the interrogations since they began. This phase will likely last no more than several days but could last up to thirty days. In this phase, you would like to employ ten techniques that you believe will dislocate his

expectations regarding the treatment he believes he will receive and encourage him to disclose the crucial information mentioned above. These ten techniques are: (1) attention grasp, (2) walling, (3) facial hold, (4) facial slap (insult slap), (5) cramped confinement, (6) wall standing, (7) stress positions, (8) sleep deprivation, (9) insects placed in a confinement box, and (10) the waterboard. You have informed us that the use of these techniques would be on an as-needed basis and that not all of these techniques will necessarily be used. The interrogation team would use these techniques in some combination to convince Zubaydah that the only way he can influence his surrounding environment is through cooperation. You have, however, informed us that you expect these techniques to be used in some sort of escalating fashion, culminating with the waterboard, though not necessarily ending with this technique. Moreover, you have also orally informed us that although some of these techniques may be used with more than once, that repetition will not be substantial because the techniques generally lose their effectiveness after several repetitions. You have also informed us that Zabaydah sustained a wound during his capture, which is being treated.

Based on the facts you have given us, we understand each of these techniques to be as follows. The attention grasp consists of grasping the individual with both hands, one hand on each side of the collar opening, in a controlled and quick motion. In the same motion as the grasp, the individual is drawn toward the interrogator.

For walling, a flexible false wall will be constructed. The individual is placed with his heels touching the wall. The interrogator pulls the individual forward and then quickly and firmly pushes the individual into the wall. It is the individual's shoulder blades that hit the wall. During this motion, the head and neck are supported with a rolled hood or towel that provides a e-collar effect to help prevent whiplash. To further reduce the probability of injury, the individual is allowed to rebound from the flexible wall. You have orally informed us that the false wall is in part constructed to create a loud sound when the individual hits it, which will further shock or surprise in the individual. In part, the idea is to create a sound that will make the impact seem far worse than it is and that will be far worse than any injury that might result from the action.

The facial hold is used to hold the head immobile. One open palm is placed on either side of the individual's face. The fingertips are kept well away from the individual's eyes.

With the facial slap or insult slap, the interrogator slaps the individual's face with fingers slightly spread. The hand makes contact with the area directly between the tip of the individual's chin and the bottom of the corresponding earlobe. The interrogator invades the individual's personal space. The goal of the facial slap is not to inflict physical pain that is severe or lasting. Instead, the purpose of the facial slap is to induce shock, surprise, and/or humiliation.

Cramped confinement involves the placement of the individual in a confined space, the dimensions of which restrict the individual's movement. The confined space is usually dark.

The duration of confinement varies based upon the size of the container. For the larger confined space, the individual can stand up or sit down; the smaller space is large enough for the subject to sit down. Confinement in the larger space can last up to eighteen hours; for the smaller space, confinement lasts for no more than two hours.

Wall standing is used to induce muscle fatigue. The individual stands about four to five feet from a wall, with his feet spread approximately to shoulder width. His arms are stretched out in front of him, with his fingers resting on the wall. His fingers support all of his body weight. The individual is not permitted to move or reposition his hands or feet.

A variety of stress positions may be used. You have informed us that these positions are not designed to produce the pain associated with contortions or twisting of the body. Rather, somewhat like walling, they are designed to produce the physical discomfort associated with muscle fatigue. Two particular stress positions are likely to be used on Zubaydah: (1) sitting on the floor with legs extended straight out in front of him with his arms raised above his head; and (2) kneeling on the floor while leaning back at a 45 degree angle. You have also orally informed us that through observing Zubaydah in captivity, you have noted that he appears to be quite flexible despite his wound.

Sleep deprivation may be used. You have indicated that your purpose in using this technique is to reduce the individual's ability to think on his feet and, through the discomfort associated with lack of sleep, to motivate him to cooperate. The effect of such sleep deprivation will generally remit after one or two nights of uninterrupted sleep. You have informed us that your research has revealed that, in rare instances, some individuals who are already predisposed to psychological problems may experience abnormal reactions to sleep deprivation. Even in those cases, however, reactions abate after the individual is permitted to sleep. Moreover, personnel with medical training are available to and will intervene in the unlikely event of an abnormal reaction. You have orally informed us that you would not deprive Zubaydah of sleep for more than eleven days at a time and that you have previously kept him awake for 72 hours, from which no mental or physical harm resulted.

You would like to place Zubaydah in a cramped confinement box with an insect. You have informed us that he appears to have a fear of insects. In particular, you would like to tell Zubaydah that you intend to place a stinging insect into the box with him. You would, however, place a harmless insect in the box. You have orally informed us that you would in fact place a harmless insect such as a caterpillar in the box with him. Your goal in so doing is to use his fears to increase his sense of dread and motivate him to avoid the box in the future by cooperating with interrogators.

Finally, you would like to use a technique called the "waterboard." In this procedure, the individual is bound securely to an inclined bench, which is approximately four feet by seven feet.

The individual's feet are generally elevated. A cloth is placed over the forehead and eyes. Water

is then applied to the cloth in a controlled manner. As this is done, the cloth is lowered until it covers both the nose and mouth. Once the cloth is saturated and completely covers the mouth and nose, air flow is slightly restricted for 20 to 40 seconds due to the presence of the cloth. This causes an increase in carbon dioxide level in the individual's blood. This increase in the carbon dioxide level stimulates increased effort to breathe. This effort plus the cloth produces the perception of "suffocation and incipient panic," i.e., the perception of drowning. The individual does not breathe any water into his lungs. During those 20 to 40 seconds, water is continuously applied from a height of twelve to twenty-four inches. After this period, the cloth is lifted, and the individual is allowed to breathe unimpeded for three or four full breaths. The sensation of drowning is immediately relieved by the removal of the cloth. The procedure may then be repeated. The water is usually applied from a canteen cup or small watering can with a spout. You have orally informed us that this procedure triggers an automatic physiological sensation of drowning that the individual cannot control even though he may be aware that he is in fact not drowning. You have also orally informed us that it is likely that this procedure would not last more than 20 minutes in any one application.

We also understand that a medical expert with SERE experience will be present throughout this phase and that the procedures will be stopped if deemed medically necessary to prevent severe mental or physical harm to Zubaydah. As mentioned above, Zubaydah suffered an injury during his capture. You have informed us that steps will be taken to ensure that this injury is not in any way exacerbated by the use of these methods and that adequate medical attention will be given to ensure that it will heal properly.

TT.

In this part, we review the context within which these procedures will be applied. You have informed us that you have taken various steps to ascertain what effect, if any, these techniques would have on Zubaydah's mental health. These same techniques, with the exception of the insect in the cramped confined space, have been used and continue to be used on some members of our military personnel during their SERE training. Because of the use of these procedures in training our own military personnel to resist interrogations, you have consulted with various individuals who have extensive experience in the use of these techniques. You have done so in order to ensure that no prolonged mental harm would result from the use of these proposed procedures.

Through your consultation with various individuals responsible for such training, you have learned that these techniques have been used as elements of a course of conduct without any reported incident of prolonged mental harm.

| of the SERE school, | has reported that, during the seven-year period that he spent in those positions, there were two requests from Congress for information concerning alleged injuries resulting from the training. One of these inquiries was prompted by the temporary physical injury a trainee sustained as result of being placed in a

confinement box. The other inquiry involved claims that the SERE training caused two individuals to engage in criminal behavior, namely, felony shoplifting and downloading child pornography onto a military computer. According to this official, these claims were found to be baseless. Moreover, he has indicated that during the three and a half years he spent as

(b)(6)

of the SERE program, he trained 10,000 students. Of those students, only two dropped out of the training following the use of these techniques. Although on rare occasions some students temporarily postponed the remainder of their training and received psychological counseling, those students were able to finish the program without any indication of subsequent mental health effects.

(b)(6)

You have informed us that you have consulted with

who has ten

years of experience with SERE training

(b)(6)

He stated that, during those

ten years, insofar as he is aware, none of the individuals who completed the program suffered any adverse mental health effects. He informed you that there was one person who did not complete the training. That person experienced an adverse mental health reaction that lasted only two hours. After those two hours, the individual's symptoms spontaneously dissipated without requiring treatment or counseling and no other symptoms were ever reported by this individual. According to the information you have provided to us, this assessment of the use of these procedures includes the use of the waterboard.

(b)(6)

Additionally you received a memorandum from the

which you supplied to us.

has experience with the use of all of these procedures in a course of conduct, with the exception of the insect in the confinement box and the waterboard. This memorandum confirms that the use of these procedures has not resulted in any reported instances of prolonged mental harm, and very few instances of immediate and temporary adverse psychological responses to the training. reported that a small minority of students have had temporary adverse

psychological reactions during training. Of the 26,829 students trained from 1992 through 2001 in the Air Force SERE training, 4.3 percent of those students had contact with psychology services. Of those 4.3 percent, only 3.2 percent were pulled from the program for psychological reasons. Thus, out of the students trained overall, only 0.14 percent were pulled from the program for psychological reasons. Furthermore, although of students having completed this training are not done, he expressed confidence that the training did not cause any long-term psychological impact. He based his conclusion on the debriefing of students that is done after the training. More importantly, he based this assessment on the fact that although training is required to be extremely stressful in order to be effective, very few complaints have been made regarding the training. During his tenure, in which 10,000 students were trained, no congressional complaints have been made. While there was one Inspector

(b)(6)

TOP SECRET

General complaint, it was not due to psychological concerns. Moreover, he was aware of only one letter inquiring about the long-term impact of these techniques from an individual trained

D0129

over twenty years ago. He found that it was impossible to attribute this individual's symptoms to his training.

concluded that if there are any long-term psychological effects of the United States Air Force training using the procedures outlined above they "are certainly minimal."

(b)(6)

With respect to the waterboard, you have also orally informed us that the Navy continues to use it in training. You have informed us that your on-site psychologists, who have extensive experience with the use of the waterboard in Navy training, have not encountered any significant long-term mental health consequences from its use. Your on-site psychologists have also indicated that JPRA has likewise not reported any significant long-term mental health consequences from the use of the waterboard. You have informed us that other services ceased use of the waterboard because it was so successful as an interrogation technique, but not because of any concerns over any harm, physical or mental, caused by it. It was also reported to be almost 100 percent effective in producing cooperation among the trainees.

Ilso indicated that he had observed the use of the waterboard in Navy training some ten to twelve times. Each time it resulted in cooperation but it did not result in any physical harm to the student.

(b)(6)

You have also reviewed the relevant literature and found no empirical data on the effect of these techniques, with the exception of sleep deprivation. With respect to sleep deprivation, you have informed us that is not uncommon for someone to be deprived of sleep for 72 hours and still perform excellently on visual-spatial motor tasks and short-term memory tests. Although some individuals may experience hallucinations, according to the literature you surveyed, those who experience such psychotic symptoms have almost always had such episodes prior to the sleep deprivation. You have indicated the studies of lengthy sleep deprivation showed no psychosis, loosening of thoughts, flattening of emotions, delusions, or paranoid ideas. In one case, even after eleven days of deprivation, no psychosis or permanent brain damaged occurred. In fact the individual reported feeling almost back to normal after one night's sleep. Further, based on the experiences with its use in military training (where it is induced for up to 48 hours), you found that rarely, if ever, will the individual suffer harm after the sleep deprivation is discontinued. Instead, the effects remit after a few good nights of sleep.

You have taken the additional step of consulting with U.S. interrogations experts, and other individuals with oversight over the SERE training process. None of these individuals was aware of any prolonged psychological effect caused by the use of any of the above techniques either separately or as a course of conduct. Moreover, you consulted with outside psychologists who reported that they were unaware of any cases where long-term problems have occurred as a result of these techniques.

Moreover, in consulting with a number of mental health experts, you have learned that the effect of any of these procedures will be dependent on the individual's personal history, cultural history and psychological tendencies. To that end, you have informed us that you have

TOP SECRET

completed a psychological assessment of Zubadyah. This assessment is based on interviews with Zubaydah, observations of him, and information collected from other sources such as intelligence and press reports. Our understanding of Zubaydah's psychological profile, which we set forth below, is based on that assessment.

According to this assessment, Zubaydah, though only 31, rose quickly from very low level mujahedin to third or fourth man in al Qaeda. He has served as Usama Bin Laden's senior lieutenant. In that capacity, he has managed a network of training camps. He has been instrumental in the training of operatives for al Qaeda, the Egyptian Islamic Jihad, and other terrorist elements inside Pakistan and Afghanistan. He acted as the Deputy Camp Commander for al Qaeda training camp in Afghanistan, personally approving entry and graduation of all trainees during 1999-2000. From 1996 until 1999, he approved all individuals going in and out of Afghanistan to the training camps. Further, no one went in and out of Peshawar, Pakistan without his knowledge and approval. He also acted as al Qaeda's coordinator of external contacts and foreign communications. Additionally, he has acted as al Qaeda's counter-intelligence officer and has been trusted to find spies within the organization.

Zubaydah has been involved in every major terrorist operation carried out by al Qaeda. He was a planner for the Millennium plot to attack U.S. and Israeli targets during the Millennium celebrations in Jordan. Two of the central figures in this plot who were arrested have identified Zubaydah as the supporter of their cell and the plot. He also served as a planner for the Paris Embassy plot in 2001. Moreover, he was one of the planners of the September 11 attacks. Prior to his capture, he was engaged in planning future terrorist attacks against U.S. interests.

Your psychological assessment indicates that it is believed Zubaydah wrote al Qaeda's manual on resistance techniques. You also believe that his experiences in al Qaeda make him well-acquainted with and well-versed in such techniques. As part of his role in al Qaeda, Zubaydah visited individuals in prison and helped them upon their release. Through this contact and activities with other al Qaeda mujahedin, you believe that he knows many stories of capture, interrogation, and resistance to such interrogation. Additionally, he has spoken with Ayman al-Zawahiri, and you believe it is likely that the two discussed Zawahiri's experiences as a prisoner of the Russians and the Egyptians.

Zubaydah stated during interviews that he thinks of any activity outside of jihad as "silly." He has indicated that his heart and mind are devoted to serving Allah and Islam through jihad and he has stated that he has no doubts or regrets about committing himself to jihad. Zubaydah believes that the global victory of Islam is inevitable. You have informed us that he continues to express his unabated desire to kill Americans and Jews.

Your psychological assessment describes his personality as follows. He is "a highly self-directed individual who prizes his independence." He has "narcissistic features," which are evidenced in the attention he pays to his personal appearance and his "obvious 'efforts' to

demonstrate that he is really a rather 'humble and regular guy." He is "somewhat compulsive" in how he organizes his environment and business. He is confident, self-assured, and possesses an air of authority. While he admits to at times wrestling with how to determine who is an "innocent," he has acknowledged celebrating the destruction of the World Trade Center. He is intelligent and intellectually curious. He displays "excellent self-discipline." The assessment describes him as a perfectionist, persistent, private, and highly capable in his social interactions. He is very guarded about opening up to others and your assessment repeatedly emphasizes that he tends not to trust others easily. He is also "quick to recognize and assess the moods and motivations of others." Furthermore, he is proud of his ability to lie and deceive others successfully. Through his deception he has, among other things, prevented the location of al Qaeda safehouses and even acquired a United Nations refugee identification card.

According to your reports, Zubaydah does not have any pre-existing mental conditions or problems that would make him likely to suffer prolonged mental harm from your proposed interrogation methods. Through reading his diaries and interviewing him, you have found no history of "mood disturbance or other psychiatric pathology[,]" "thought disorder[,] ... enduring mood or mental health problems." He is in fact "remarkably resilient and confident that he can overcome adversity." When he encounters stress or low mood, this appears to last only for a short time. He deals with stress by assessing its source, evaluating the coping resources available to him, and then taking action. Your assessment notes that he is "generally self-sufficient and relies on his understanding and application of religious and psychological principles, intelligence and discipline to avoid and overcome problems." Moreover, you have found that he has a "reliable and durable support system" in his faith, "the blessings of religious leaders, and camaraderie of like-minded mujahedin brothers." During detention, Zubaydah has managed his mood, remaining at most points "circumspect, calm, controlled, and deliberate." He has maintained this demeanor during aggressive interrogations and reductions in sleep. You describe that in an initial confrontational incident, Zubaydah showed signs of sympathetic nervous system arousal, which you think was possibly fear. Although this incident led him to disclose intelligence information, he was able to quickly regain his composure, his air of confidence, and his "strong resolve" not to reveal any information.

Overall, you summarize his primary strengths as the following: ability to focus, goal-directed discipline, intelligence, emotional resilience, street savvy, ability to organize and manage people, keen observation skills, fluid adaptability (can anticipate and adapt under duress and with minimal resources), capacity to assess and exploit the needs of others, and ability to adjust goals to emerging opportunities.

You anticipate that he will draw upon his vast knowledge of interrogation techniques to cope with the interrogation. Your assessment indicates that Zubaydah may be willing to die to protect the most important information that he holds. Nonetheless, you are of the view that his belief that Islam will ultimately dominate the world and that this victory is inevitable may provide the chance that Zubaydah will give information and rationalize it solely as a temporary

setback. Additionally, you believe he may be willing to disclose some information, particularly information he deems to not be critical, but which may ultimately be useful to us when pieced together with other intelligence information you have gained.

III.

Section 2340A makes it a criminal offense for any person "outside of the United States [to] commit[] or attempt[] to commit torture." Section 2340(1) defines torture as:

an act committed by a person acting under the color of law specifically intended to inflict severe physical or mental pain or suffering (other than pain or suffering incidental to lawful sanctions) upon another person within his custody of physical control.

18 U.S.C. § 2340(1). As we outlined in our opinion on standards of conduct under Section 2340A, a violation of 2340A requires a showing that: (1) the torture occurred outside the United States; (2) the defendant acted under the color of law; (3) the victim was within the defendant's custody or control; (4) the defendant specifically intended to inflict severe pain or suffering; and (5) that the acted inflicted severe pain or suffering. See Memorandum for John Rizzo, Acting General Counsel for the Central Intelligence Agency, from Jay S. Bybee, Assistant Attorney General, Office of Legal Counsel, Re: Standards of Conduct for Interrogation under 18 U.S.C. §§ 2340-2340A at 3 (August 1, 2002) ("Section 2340A Memorandum"). You have asked us to assume that Zubayadah is being held outside the United States, Zubayadah is within U.S. custody, and the interrogators are acting under the color of law. At issue is whether the last two elements would be met by the use of the proposed procedures, namely, whether those using these procedures would have the requisite mental state and whether these procedures would inflict severe pain or suffering within the meaning of the statute.

Severe Pain or Suffering. In order for pain or suffering to rise to the level of torture, the statute requires that it be severe. As we have previously explained, this reaches only extreme acts. See id. at 13. Nonetheless, drawing upon cases under the Torture Victim Protection Act (TVPA), which has a definition of torture that is similar to Section 2340's definition, we found that a single event of sufficiently intense pain may fall within this prohibition. See id. at 26. As a result, we have analyzed each of these techniques separately. In further drawing upon those cases, we also have found that courts tend to take a totality-of-the-circumstances approach and consider an entire course of conduct to determine whether torture has occurred. See id. at 27. Therefore, in addition to considering each technique separately, we consider them together as a course of conduct.

Section 2340 defines torture as the infliction of severe physical or mental pain or suffering. We will consider physical pain and mental pain separately. See 18 U.S.C. § 2340(1).—With respect to physical pain, we previously concluded that "severe pain" within the meaning of

Section 2340 is pain that is difficult for the individual to endure and is of an intensity akin to the pain accompanying serious physical injury. See Section 2340A Memorandum at 6. Drawing upon the TVPA precedent, we have noted that examples of acts inflicting severe pain that typify torture are, among other things, severe beatings with weapons such as clubs, and the burning of prisoners. See id at 24. We conclude below that none of the proposed techniques inflicts such pain.

The facial hold and the attention grasp involve no physical pain. In the absence of such pain it is obvious that they cannot be said to inflict severe physical pain or suffering. The stress positions and wall standing both may result in muscle fatigue. Each involves the sustained holding of a position. In wall standing, it will be holding a position in which all of the individual's body weight is placed on his finger tips. The stress positions will likely include sitting on the floor with legs extended straight out in front and arms raised above the head, and kneeling on the floor and leaning back at a 45 degree angle. Any pain associated with muscle fatigue is not of the intensity sufficient to amount to "severe physical pain or suffering" under the statute, nor, despite its discomfort, can it be said to be difficult to endure. Moreover, you have orally informed us that no stress position will be used that could interfere with the healing of Zubaydah's wound. Therefore, we conclude that these techniques involve discomfort that falls far below the threshold of severe physical pain.

Similarly, although the confinement boxes (both small and large) are physically uncomfortable because their size restricts movement, they are not so small as to require the individual to contort his body to sit (small box) or stand (large box). You have also orally informed us that despite his wound, Zubaydah remains quite flexible, which would substantially reduce any pain associated with being placed in the box. We have no information from the medical experts you have consulted that the limited duration for which the individual is kept in the boxes causes any substantial physical pain. As a result, we do not think the use of these boxes can be said to cause pain that is of the intensity associated with serious physical injury.

The use of one of these boxes with the introduction of an insect does not alter this assessment. As we understand it, no actually hamful insect will be placed in the box. Thus, though the introduction of an insect may produce trepidation in Zubaydah (which we discuss below), it certainly does not cause physical pain.

As for sleep deprivation, it is clear that depriving someone of sleep does not involve severe physical pain within the meaning of the statute. While sleep deprivation may involve some physical discomfort, such as the fatigue or the discomfort experienced in the difficulty of keeping one's eyes open, these effects remit after the individual is permitted to sleep. Based on the facts you have provided us, we are not aware of any evidence that sleep deprivation results in severe physical pain or suffering. As a result, its use does not violate Section 2340A.

Even those techniques that involve physical contact between the interrogator and the

individual do not result in severe pain. The facial slap and walling contain precautions to ensure that no pain even approaching this level results. The slap is delivered with fingers slightly spread, which you have explained to us is designed to be less painful than a closed-hand slap. The slap is also delivered to the fleshy part of the face, further reducing any risk of physical damage or serious pain. The facial slap does not produce pain that is difficult to endure. Likewise, walling involves quickly pulling the person forward and then thrusting him against a flexible false wall. You have informed us that the sound of hitting the wall will actually be far worse than any possible injury to the individual. The use of the rolled towel around the neck also reduces any risk of injury. While it may hurt to be pushed against the wall, any pain experienced is not of the intensity associated with serious physical injury.

As we understand it, when the waterboard is used, the subject's body responds as if the subject were drowning—even though the subject may be well aware that he is in fact not drowning. You have informed us that this procedure does not inflict actual physical harm. Thus, although the subject may experience the fear or panic associated with the feeling of drowning, the waterboard does not inflict physical pain. As we explained in the Section 2340A Memorandum, "pain and suffering" as used in Section 2340 is best understood as a single concept, not distinct concepts of "pain" as distinguished from "suffering." See Section 2340A Memorandum at 6 n.3. The waterboard, which inflicts no pain or actual harm whatsoever, does not, in our view inflict "severe pain or suffering." Even if one were to parse the statute more finely to attempt to treat "suffering" as a distinct concept, the waterboard could not be said to inflict severe suffering. The waterboard is simply a controlled acute episode, lacking the connotation of a protracted period of time generally given to suffering.

Finally, as we discussed above, you have informed us that in determining which procedures to use and how you will use them, you have selected techniques that will not harm Zubaydah's wound. You have also indicated that numerous steps will be taken to ensure that none of these procedures in any way interferes with the proper healing of Zubaydah's wound. You have also indicated that, should it appear at any time that Zubaydah is experiencing severe pain or suffering, the medical personnel on hand will stop the use of any technique.

Even when all of these methods are considered combined in an overall course of conduct, they still would not inflict severe physical pain or suffering. As discussed above, a number of these acts result in no physical pain, others produce only physical discomfort. You have indicated that these acts will not be used with substantial repetition, so that there is no possibility that severe physical pain could arise from such repetition. Accordingly, we conclude that these acts neither separately nor as part of a course of conduct would inflict severe physical pain or suffering within the meaning of the statute.

We next consider whether the use of these techniques would inflict severe mental pain or suffering within the meaning of Section 2340. Section 2340 defines severe mental pain or suffering as "the prolonged mental harm caused by or resulting from" one of several predicate

acts. 18 U.S.C. § 2340(2). Those predicate acts are: (1) the intentional infliction or threatened infliction of severe physical pain or suffering; (2) the administration or application, or threatened administration or application of mind-altering substances or other procedures calculated to disrupt profoundly the senses or the personality; (3) the threat of imminent death; or (4) the threat that any of the preceding acts will be done to another person. See 18 U.S.C. § 2340(2)(A)—(D). As we have explained, this list of predicate acts is exclusive. See Section 2340A Memorandum at 8. No other acts can support a charge under Section 2340A based on the infliction of severe mental pain or suffering. See id. Thus, if the methods that you have described do not either in and of themselves constitute one of these acts or as a course of conduct fulfill the predicate act requirement, the prohibition has not been violated. See id. Before addressing these techniques, we note that it is plain that none of these procedures involves a threat to any third party, the use of any kind of drugs, or for the reasons described above, the infliction of severe physical pain. Thus, the question is whether any of these acts, separately or as a course of conduct, constitutes a threat of severe physical pain or suffering, a procedure designed to disrupt profoundly the senses, or a threat of imminent death. As we previously explained, whether an action constitutes a threat must be assessed from the standpoint of a reasonable person in the subject's position. See id. at

No argument can be made that the attention grasp or the facial hold constitute threats of imminent death or are procedures designed to disrupt profoundly the senses or personality. In general the grasp and the facial hold will startle the subject, produce fear, or even insult him. As you have informed us, the use of these techniques is not accompanied by a specific verbal threat of severe physical pain or suffering. To the extent that these techniques could be considered a threat of severe physical pain or suffering, such a threat would have to be inferred from the acts themselves. Because these actions themselves involve no pain, neither could be interpreted by a reasonable person in Zubaydah's position to constitute a threat of severe pain or suffering. Accordingly, these two techniques are not predicate acts within the meaning of Section 2340.

The facial slap likewise falls outside the set of predicate acts. It plainly is not a threat of imminent death, under Section 2340(2)(C), or a procedure designed to disrupt profoundly the senses or personality, under Section 2340(2)(B). Though it may hurt, as discussed above, the effect is one of smarting or stinging and surprise or humiliation, but not severe pain. Nor does it alone constitute a threat of severe pain or suffering, under Section 2340(2)(A). Like the facial hold and the attention grasp, the use of this slap is not accompanied by a specific verbal threat of further escalating violence. Additionally, you have informed us that in one use this technique will typically involve at most two slaps. Certainly, the use of this slap may dislodge any expectation that Zubaydah had that he would not be touched in a physically aggressive manner. Nonetheless, this alteration in his expectations could hardly be construed by a reasonable person in his situation to be tantamount to a threat of severe physical pain or suffering. At most, this technique suggests that the circumstances of his confinement and interrogation have changed. Therefore, the facial slap is not within the statute's exclusive list of predicate acts.

Walling plainly is not a procedure calculated to disrupt profoundly the senses or personality. While walling involves what might be characterized as rough handling, it does not involve the threat of imminent death or, as discussed above, the infliction of severe physical pain. Moreover, once again we understand that use of this technique will not be accompanied by any specific verbal threat that violence will ensue absent cooperation. Thus, like the facial slap, walling can only constitute a threat of severe physical pain if a reasonable person would infer such a threat from the use of the technique itself. Walling does not in and of itself inflict severe pain or suffering. Like the facial slap, walling may alter the subject's expectation as to the treatment he believes he will receive. Nonetheless, the character of the action falls so far short of inflicting severe pain or suffering within the meaning of the statute that even if he inferred that greater aggressiveness was to follow, the type of actions that could be reasonably be anticipated would still fall below anything sufficient to inflict severe physical pain or suffering under the statute. Thus, we conclude that this technique falls outside the proscribed predicate acts.

Like walling, stress positions and wall-standing are not procedures calculated to disrupt profoundly the senses, nor are they threats of imminent death. These procedures, as discussed above, involve the use of muscle fatigue to encourage cooperation and do not themselves constitute the infliction of severe physical pain or suffering. Moreover, there is no aspect of violence to either technique that remotely suggests future severe pain or suffering from which such a threat of future harm could be inferred. They simply involve forcing the subject to remain in uncomfortable positions. While these acts may indicate to the subject that he may be placed in these positions again if he does not disclose information, the use of these techniques would not suggest to a reasonable person in the subject's position that he is being threatened with severe pain or suffering. Accordingly, we conclude that these two procedures do not constitute any of the predicate acts set forth in Section 2340(2).

As with the other techniques discussed so far, cramped confinement is not a threat of imminent death. It may be argued that, focusing in part on the fact that the boxes will be without light, placement in these boxes would constitute a procedure designed to disrupt profoundly the senses. As we explained in our recent opinion, however, to "disrupt profoundly the senses" a technique must produce an extreme effect in the subject. See Section 2340A Memorandum at 10–12. We have previously concluded that this requires that the procedure cause substantial interference with the individual's cognitive abilities or fundamentally alter his personality. See id. at 11. Moreover, the statute requires that such procedures must be calculated to produce this effect. See id. at 10; 18 U.S.C. § 2340(2)(B).

With respect to the small confinement box, you have informed us that he would spend at most two hours in this box. You have informed us that your purpose in using these boxes is not to interfere with his senses or his personality, but to cause him physical discomfort that will encourage him to disclose critical information. Moreover, your imposition of time limitations on the use of either of the boxes also indicates that the use of these boxes is not designed or calculated to disrupt profoundly the senses or personality. For the larger box, in which he can

both stand and sit, he may be placed in this box for up to eighteen hours at a time, while you have informed us that he will never spend more than an hour at time in the smaller box. These time limits further ensure that no profound disruption of the senses or personality, were it even possible, would result. As such, the use of the confinement boxes does not constitute a procedure calculated to disrupt profoundly the senses or personality.

Nor does the use of the boxes threaten Zubaydah with severe physical pain or suffering. While additional time spent in the boxes may be threatened, their use is not accompanied by any express threats of severe physical pain or suffering. Like the stress positions and walling, placement in the boxes is physically uncomfortable but any such discomfort does not rise to the level of severe physical pain or suffering. Accordingly, a reasonable person in the subject's position would not infer from the use of this technique that severe physical pain is the next step in his interrogator's treatment of him. Therefore, we conclude that the use of the confinement boxes does not fall within the statute's required predicate acts.

In addition to using the confinement boxes alone, you also would like to introduce an insect into one of the boxes with Zubaydah. As we understand it, you plan to inform Zubaydah that you are going to place a stinging insect into the box, but you will actually place a harmless insect in the box, such as a caterpillar. If you do so, to ensure that you are outside the predicate act requirement, you must inform him that the insects will not have a sting that would produce death or severe pain. If, however, you were to place the insect in the box without informing him that you are doing so, then, in order to not commit a predicate act, you should not affirmatively lead him to believe that any insect is present which has a sting that could produce severe pain or suffering or even cause his death. While placing the insect in the box may certainly play upon fears that you believe that Zubaydah may harbor regarding insects, so long as you take either of the approaches we have described, the insect's placement in the box would not constitute a threat of severe physical pain or suffering to a reasonable person in his position. An individual placed in a box, even an individual with a fear of insects, would not reasonably feel threatened with severe physical pain or suffering if a caterpillar was placed in the box. Further, you have informed us that you are not aware that Zubaydah has any allergies to insects, and you have not informed us of any other factors that would cause a reasonable person in that same situation to believe that an unknown insect would cause him severe physical pain or death. Thus, we conclude that the placement of the insect in the confinement box with Zubaydah would not constitute a predicate act.

Sleep deprivation also clearly does not involve a threat of imminent death. Although it produces physical discomfort, it cannot be said to constitute a threat of severe physical pain or suffering from the perspective of a reasonable person in Zubaydah's position. Nor could sleep deprivation constitute a procedure calculated to disrupt profoundly the senses, so long as sleep deprivation (as you have informed us is your intent) is used for limited periods, before hallucinations or other profound disruptions of the senses would occur. To be sure, sleep deprivation may reduce the subject's ability to think on his feet. Indeed, you indicate that this is

the intended result. His mere reduced ability to evade your questions and resist answering does not, however, rise to the level of disruption required by the statute. As we explained above, a disruption within the meaning of the statute is an extreme one, substantially interfering with an individual's cognitive abilities, for example, inducing hallucinations, or driving him to engage in uncharacteristic self-destructive behavior. See infra 13; Section 2340A Memorandum at 11. Therefore, the limited use of sleep deprivation does not constitute one of the required predicate acts.

We find that the use of the waterboard constitutes a threat of imminent death. As you have explained the waterboard procedure to us, it creates in the subject the uncontrollable physiological sensation that the subject is drowning. Although the procedure will be monitored by personnel with medical training and extensive SERE school experience with this procedure who will ensure the subject's mental and physical safety, the subject is not aware of any of these precautions. From the vantage point of any reasonable person undergoing this procedure in such circumstances, he would feel as if he is drowning at very moment of the procedure due to the uncontrollable physiological sensation he is experiencing. Thus, this procedure cannot be viewed as too uncertain to satisfy the imminence requirement. Accordingly, it constitutes a threat of imminent death and fulfills the predicate act requirement under the statute.

Although the waterboard constitutes a threat of imminent death, prolonged mental harm must nonetheless result to violate the statutory prohibition on infliction of severe mental pain or suffering. See Section 2340A Memorandum at 7. We have previously concluded that prolonged mental harm is mental harm of some lasting duration, e.g., mental harm lasting months or years. See id. Prolonged mental harm is not simply the stress experienced in, for example, an interrogation by state police. See id. Based on your research into the use of these methods at the SERE school and consultation with others with expertise in the field of psychology and interrogation, you do not anticipate that any prolonged mental harm would result from the use of the waterboard. Indeed, you have advised us that the relief is almost immediate when the cloth is removed from the nose and mouth. In the absence of prolonged mental harm, no severe mental pain or suffering would have been inflicted, and the use of these procedures would not constitute torture within the meaning of the statute.

When these acts are considered as a course of conduct, we are unsure whether these acts may constitute a threat of severe physical pain or suffering. You have indicated to us that you have not determined either the order or the precise timing for implementing these procedures. It is conceivable that these procedures could be used in a course of escalating conduct, moving incrementally and rapidly from least physically intrusive, e.g., facial hold, to the most physical contact, e.g., walling or the waterboard. As we understand it, based on his treatment so far, Zubaydah has come to expect that no physical harm will be done to him. By using these techniques in increasing intensity and in rapid succession, the goal would be to dislodge this expectation. Based on the facts you have provided to us, we cannot say definitively that the entire course of conduct would cause a reasonable person to believe that he is being threatened

with severe pain or suffering within the meaning of section 2340. On the other hand, however, under certain circumstances—for example, rapid escalation in the use of these techniques culminating in the waterboard (which we acknowledge constitutes a threat of imminent death) accompanied by verbal or other suggestions that physical violence will follow—might cause a reasonable person to believe that they are faced with such a threat. Without more information, we are uncertain whether the course of conduct would constitute a predicate act under Section 2340(2).

Even if the course of conduct were thought to pose a threat of physical pain or suffering, it would nevertheless—on the facts before us—not constitute a violation of Section 2340A. Not only must the course of conduct be a predicate act, but also those who use the procedure must actually cause prolonged mental harm. Based on the information that you have provided to us, indicating that no evidence exists that this course of conduct produces any prolonged mental harm, we conclude that a course of conduct using these procedures and culminating in the waterboard would not violate Section 2340A.

Specific Intent. To violate the statute, an individual must have the specific intent to inflict severe pain or suffering. Because specific intent is an element of the offense, the absence of specific intent negates the charge of torture. As we previously opined, to have the required specific intent, an individual must expressly intend to cause such severe pain or suffering. See Section 2340A Memorandum at 3 citing Carter v. United States, 530 U.S. 255, 267 (2000). We have further found that if a defendant acts with the good faith belief that his actions will not cause such suffering, he has not acted with specific intent. See id. at 4 citing South Atl. Lmtd. Ptrshp. of Tenn. v. Reise, 218 F.3d 518, 531 (4th Cir. 2002). A defendant acts in good faith when he has an honest belief that his actions will not result in severe pain or suffering. See id. citing Cheek v. United States, 498 U.S. 192, 202 (1991). Although an honest belief need not be reasonable, such a belief is easier to establish where there is a reasonable basis for it. See id. at 5. Good faith may be established by, among other things, the reliance on the advice of experts. See id. at 8.

Based on the information you have provided us, we believe that those carrying out these procedures would not have the specific intent to inflict severe physical pain or suffering. The objective of these techniques is not to cause severe physical pain. First, the constant presence of personnel with medical training who have the authority to stop the interrogation should it appear it is medically necessary indicates that it is not your intent to cause severe physical pain. The personnel on site have extensive experience with these specific techniques as they are used in SERE school training. Second, you have informed us that you are taking steps to ensure that Zubaydah's injury is not worsened or his recovery impeded by the use of these techniques.

Third, as you have described them to us, the proposed techniques involving physical contact between the interrogator and Zubaydah actually contain precautions to prevent any serious physical harm to Zubaydah. In "walling," a rolled hood or towel will be used to prevent

whiplash and he will be permitted to rebound from the flexible wall to reduce the likelihood of injury. Similarly, in the "facial hold," the fingertips will be kept well away from the his eyes to ensure that there is no injury to them. The purpose of that facial hold is not injure him but to hold the head immobile. Additionally, while the stress positions and wall standing will undoubtedly result in physical discomfort by tiring the muscles, it is obvious that these positions are not intended to produce the kind of extreme pain required by the statute.

Furthermore, no specific intent to cause severe mental pain or suffering appears to be present. As we explained in our recent opinion, an individual must have the specific intent to cause prolonged mental harm in order to have the specific intent to inflict severe mental pain or suffering. See Section 2340A Memorandum at 8. Prolonged mental harm is substantial mental harm of a sustained duration, e.g., harm lasting months or even years after the acts were inflicted upon the prisoner. As we indicated above, a good faith belief can negate this element. Accordingly, if an individual conducting the interrogation has a good faith belief that the procedures he will apply, separately or together, would not result in prolonged mental harm, that individual lacks the requisite specific intent. This conclusion concerning specific intent is further bolstered by the due diligence that has been conducted concerning the effects of these interrogation procedures.

The mental health experts that you have consulted have indicated that the psychological impact of a course of conduct must be assessed with reference to the subject's psychological history and current mental health status. The healthier the individual, the less likely that the use of any one procedure or set of procedures as a course of conduct will result in prolonged mental harm. A comprehensive psychological profile of Zubaydah has been created. In creating this profile, your personnel drew on direct interviews, Zubaydah's diaries, observation of Zubaydah since his capture, and information from other sources such as other intelligence and press reports. You found that Zubaydah has no history of mental health problems. Your profile further emphasizes that, in addition to his excellent mental health history, he is quite resilient. Not only is Zubaydah resilient, but you have also found that he has in place a durable support system through his faith, the blessings of religious leaders, and the camaraderie he has experienced with those who have taken up the cause with him. Based on this remarkably healthy profile, you have concluded that he would not experience any mental harm of sustained duration from the use of these techniques, either separately or as a course of conduct.

As we indicated above, you have informed us that your proposed interrogation methods have been used and continue to be used in SERE training. It is our understanding that these techniques are not used one by one in isolation, but as a full course of conduct to resemble a real interrogation. Thus, the information derived from SERE training bears both upon the impact of the use of the individual techniques and upon their use as a course of conduct. You have found that the use of these methods together or separately, including the use of the waterboard, has not resulted in any negative long-term mental health consequences. The continued use of these methods without mental health consequences to the trainees indicates that it is highly improbable

that such consequences would result here. Because you have conducted the due diligence to determine that these procedures, either alone or in combination, do not produce prolonged mental harm, we believe that you do not meet the specific intent requirement necessary to violate Section 2340A.

You have also informed us that you have reviewed the relevant literature on the subject, and consulted with outside psychologists. Your review of the literature uncovered no empirical data on the use of these procedures, with the exception of sleep deprivation for which no longterm health consequences resulted. The outside psychologists with whom you consulted indicated were unaware of any cases where long-term problems have occurred as a result of these techniques.

As described above, it appears you have conducted an extensive inquiry to ascertain what impact, if any, these procedures individually and as a course of conduct would have on Zubaydah. You have consulted with interrogation experts; including those with substantial SERE school experience, consulted with outside psychologists, completed a psychological assessment and reviewed the relevant literature on this topic. Based on this inquiry, you believe that the use of the procedures, including the waterboard, and as a course of conduct would not result in prolonged mental harm. Reliance on this information about Zubaydah and about the effect of the use of these techniques more generally demonstrates the presence of a good faith belief that no prolonged mental harm will result from using these methods in the interrogation of Zubaydah. Moreover, we think that this represents not only an honest belief but also a reasonable belief based on the information that you have supplied to us. Thus, we believe that the specific intent to inflict prolonged mental is not present, and consequently, there is no specific intent to inflict severe mental pain or suffering. Accordingly, we conclude that on the facts in this case the use of these methods separately or a course of conduct would not violate Section 2340A

Based on the foregoing, and based on the facts that you have provided, we conclude that the interrogation procedures that you propose would not violate Section 2340A. We wish to emphasize that this is our best reading of the law; however, you should be aware that there are no cases construing this statute, just as there have been no prosecutions brought under it.

Please let us know if we can be of further assistance.

Guidelines on Confinement Conditions For CIA Detainees

These Guidelines govern the conditions of confinement for CIA Detainees, who are persons detained in detention facilities that are under the control of CIA ("Detention Facilities").

(b)(1) (b)(3) NatSecAct

These Guidelines recognize that environmental and other conditions, as well as particularized considerations affecting any given Detention Facility, will vary from case to case and location to location.

1. Minimums

Due provision must be taken to protect the health and safety of all CTA Detainees, including basic levels of medical care (which need not comport with the highest standards of medical care that is provided in US-based medical facilities); food and drink which meets minimum medically appropriate nutritional and sanitary standards; clothing and/or a physical environment sufficient to meet basic health needs; periods of time within which detainees are free to engage in physical exercise (which may be limited, for example, to exercise within the isolation cells themselves); and sanitary facilities (which may, for example, comprise buckets for the relief of personal waste). Conditions of confinement at the Detention Facilities do not have to conform with US prison or other specific or pre-established standards.

2. Implementing Procedures

a. Medical and, as appropriate, psychological personnel shall be physically present at, or reasonably available to, each Detention Facility. Medical personnel shall check the physical condition of each detainee at intervals appropriate to the circumstances and shall keep appropriate records.

ALL PORTIONS OF THIS DOCUMENT ARE CLASSIFIED TOP SECRET

(b)(1)

(b)(3) NatSecAct

3. Responsible CIA Officer

The Director, DCI Counterterrorist Center shall ensure (a) that, at all times, a specific Agency staff employee (the "Responsible CIA Officer") is designated as responsible for each specific Detention Facility, (b) that each Responsible CIA Officer has been provided with a copy of these Guidelines and has reviewed and signed the attached Acknowledgment, and (c) that each Responsible CIA Officer and each CIA officer participating in the questioning of individuals detained pursuant to the Memorandum of Notification of 17 September 2001 has been provided with a copy of the "Guidelines on Interrogation Conducted Pursuant to the Presidential Memorandum of 17 September 2001" and has reviewed and signed the Acknowledgment attached thereto. Subject to operational and security considerations, the Responsible CIA Officer shall be present at, or visit, each Detention Facility at intervals appropriate to the circumstances.

TOP SECRE(b)(1) NatSecAct

Guidelines on Interrogations Conducted Pursuant to the Presidential Memorandum of Motification of 17 September 2001

These Guidelines address the conduct of interrogations of persons who are detained pursuant to the authorities set forth in the Memorandum of Notification of 17 September 2001.

(b)(1) (b)(3) NatSecAct

These Guidelines complement internal Directorate of Operations guidance relating to the conduct of interrogations. In the event of any inconsistency between existing DO guidance and these Guidelines, the provisions of these Guidelines shall control.

1. Permissible Interrogation Techniques

Unless otherwise approved by Headquarters, CIA officers and other personnel acting on behalf of CIA may use only Permissible Interrogation Techniques. Permissible Interrogation Techniques consist of both (a) Standard Techniques and (b) Enhanced Techniques.

Standard Techniques are techniques that do not incorporate physical or substantial psychological pressure. These techniques include, but are not limited to, all lawful forms of questioning employed by US law enforcement and military interrogation personnel. Among Standard Techniques are the use of isolation, sleep deprivation not to exceed 72 hours, reduced caloric intake (so long as the amount is calculated to maintain the general health of the detainee), deprivation of reading material, use of loud music or white noise (at a decibel level calculated to avoid damage to the detainee's hearing), and the use of diapers for limited periods (generally not to exceed 72 hours, or during transportation where appropriate).

ALL PORTIONS OF THIS DOCUMENT ARE CLASSIFIED TOP SECRET (b)(3) CIAAct (b)(3) NatSecAct

TOP SECRET (b)(1) NatSecAct

(b)(1) (b)(3) NatSecAct

Guideline on Interrogations Conducted Pursuant to the Presidential Memorandaum of Notification of 17 September 2001

Enhanced Techniques are techniques that do incorporate physical or psychological pressure beyond Standard Techniques. The use of each specific Enhanced Technique must be approved by Headquarters in advance, and may be employed only by approved interrogators for use with the specific detainee, with appropriate medical and psychological participation in the process. These techniques are, the attention grasp, walling, the facial hold, the facial slap (insult slap), the abdominal slap, cramped confinement, wall standing, stress positions, sleep deprivation beyond 72 hours, the use of diapers for prolonged periods, the use of harmless insects, the water board, and such other techniques as may be specifically approved pursuant to paragraph 4 below. The use of each Enhanced Technique is subject to specific temporal, physical, and related conditions, including a competent evaluation of the medical and psychological state of the detainee.

2. Medical and Psychological Personnel

Appropriate medical and psychological personnel shall be either on site or readily available for consultation and travel to the interrogation site during all detainee interrogations employing Standard Techniques, and appropriate medical and psychological personnel must be on site during all detainee interrogations employing Enhanced Techniques. In each case, the medical and psychological personnel shall suspend the interrogation if they determine that significant and prolonged physical or mental injury, pain, or suffering is likely to result if the interrogation is not suspended. In any such instance, the interrogation team shall immediately report the facts to Headquarters for management and legal review to determine whether the interrogation may be resumed.

3. Interrogation Personnel

The Director, DCI Counterterrorist Center shall ensure that all personnel directly engaged in the interrogation of persons detained pursuant to the authorities set forth in the MoN have been appropriately screened (from the medical, psychological, and security standpoints), have reviewed these Guidelines, have received appropriate training in their implementation, and have completed the attached Acknowledgment.

TOP SECRET

(b)(1)

(b)(3) NatSecAct

Guideline on Interrogations Conducted Pursuant to the Presidential Memorandaum of Notification of 17 September 2001

4. Approvals Required

Whenever feasible, advance approval is required for the use of Standard Techniques by an interrogation team. all instances, their use shall be documented in cable traffic. Prior approval in writing (e.g., by written memorandum or in cable traffic) from the Director, DCI Counterterrorist Center, with the concurrence of the Chief, CTC Legal Group, is required for the use of any Enhanced Technique(s), and may be provided only where D/CTC has determined that (a) the specific detainee is believed to possess information about risks to the citizens of the United States or other nations, (b) the use of the Enhanced Technique(s) is appropriate in order to obtain that information, (c) appropriate medical and psychological personnel have concluded that the use of the Enhanced Technique(s) is not expected to produce *severe physical or mental pain or suffering, " and (d) the personnel authorized to employ the Enhanced Technique(s) have completed the attached Acknowledgment. Nothing in these Guidelines alters the right to act in self-defense.

5. Recordkeeping

In each interrogation session in which an Enhanced Technique is employed, a contemporaneous record shall be created setting forth the nature and duration of each such technique employed, the identities of those present, and a citation to the required Headquarters approval cable. This information, which may be in the form of a cable, shall be provided to Headquarters.

TOP SECRET/

DRAFT OMS GUIDELINES ON MEDICAL AND PSYCHOLOGICAL SUPPORT TO DETAINEE INTERROGATIONS September 4, 2003

The following guidelines offer general references for medical officers supporting the detention of terrorists captured and turned over to the Central Intelligence Agency for interrogation and debriefing. There are three different contexts in which these guidelines may be applied: (1) during the period of initial interrogation, (2) during the more sustained period of debriefing at an interrogation site, and (3) the permanent detention of captured terrorists in long-term facilities.

INTERROGATION SUPPORT

Captured terrorists turned over to the C.I.A. for interrogation may be subjected to a wide range of legally sanctioned techniques, all of which are also used on U.S. military personnel in SERE training programs. These are designed to psychologically "dislocate" the detainee, maximize his feeling of vulnerability and helplessness, and reduce or eliminate his will to resist our efforts to obtain critical intelligence.

Sanctioned interrogation techniques must be specifically approved in advance by the Director, CTC in the case of each individual case. They include, in approximately ascending degree of intensity:

Standard measures (i.e., without physical or substantial psychological pressure)

Shaving

Stripping

Diapering (generally for periods not greater than 72 hours)

Hooding

Isolation

White noise or loud music (at a decibel level that will not damage hearing)

Continuous light or darkness

Uncomfortably cool environment

Restricted diet, including reduced caloric intake (sufficient to maintain general health)

Shackling in upright, sitting, or horizontal position

Water Dousing

Sleep deprivation (up to 72 hours)

Enhanced measures (with physical or psychological pressure beyond the above)

Attention grasp

Facial hold

Insult (facial) slap

(b)(1) (b)(3) **N**at:

(b)(3) NatSecAct

1

TOP SECRET/

(b)(1)
TOP SECRET/

Abdominal slap
Prolonged diapering
Sleep deprivation (over 72 hours)
Stress positions

-on knees, body slanted forward or backward

-leaning with forehead on wall

Walling

Cramped confinement (Confinement boxes)

Waterboard

In all instances the general goal of these techniques is a psychological impact, and not some physical effect, with a specific goal of "dislocat[ing] his expectations regarding the treatment he believes he will receive...." The more physical techniques are delivered in a manner carefully limited to avoid serious physical harm. The slaps for example are designed "to induce shock, surprise, and/or humiliation" and "not to inflict physical pain that is severe or lasting." To this end they must be delivered in a specifically circumscribed manner, e.g., with fingers spread. Walling is only against a springboard designed to be loud and bouncy (and cushion the blow). All walling and most attention grasps are delivered only with the subject's head solidly supported with a towel to avoid extension-flexion injury.

OMS is responsible for assessing and monitoring the health of all Agency detainees subject to "enhanced" interrogation techniques, and for determining that the authorized administration of these techniques would not be expected to cause serious or permanent harm. "DCI Guidelines" have been issued formalizing these responsibilities, and these should be read directly.

Whenever feasible, advance approval is required to use any measures beyond standard measures; technique-specific advanced approval is required for all "enhanced" measures and is conditional on on-site medical and psychological personnel² confirming from direct detainee examination that the enhanced technique(s) is not expected to produce "severe physical or mental pain or suffering." As a practical matter, the detainee's physical condition must be such that these interventions will not have lasting

TOP SECRET!

¹ The standard used by the Justice Department for "mental" harm is "prolonged mental harm," i.e., "mental harm of some lasting duration, e.g., mental harm lasting months or years." "In the absence of prolonged mental harm, no severe mental pain or suffering would have been inflicted." Memorandum of August 1, 2002, p. 15.

² "Psychological personnel" can be either a clinical psychologist or a psychiatrist.

Unless the waterboard is being used, the medical officer can be a physician or a PA; use of the waterboard requires the presence of a physician.

` / ` /			

effect, and his psychological state strong enough that no severe psychological harm will result.

The medical implications of the DCI guidelines are discussed below.

General intake evaluation

New detainees are to have a thorough initial medical assessment, with a complete, documented history and physical addressing in depth any chronic or previous medical problems. This should especially attend to cardio-vascular, pulmonary, neurological and musculo-skeletal findings. (See the section on shackling and waterboard for more specifics.) Vital signs and weight should be recorded, and blood work drawn ("tiger" top [serum separating] and lavender top tubes) for CBC, Hepatitis B and C, HIV and Chem panel (to include albumin and liver function tests).

Documented subsequent medical rechecks should be performed on a regular basis, the frequency being within the judgment of the medical representative and the Chief of Site. The recheck can be more focused on relevant factors. The content of the documentation should be similar to what would ordinarily be recorded in a medical chart. Although brief, the data should reflect what was checked and include negative findings. All assessments should be reported through approved communications channels applicable to the site in which the detainee is held, and subject to review/release by the Chief of the site. This should include an A copy of the medical findings should also be included in an electronic file maintained locally on each detainee, which incorporates all medical evaluations on that individual. This file must be available to successive medical practitioners at site.

Medical treatment

It is important that adequate medical care be provided to detainees, even those undergoing enhanced interrogation. Those requiring chronic medications should receive them, acute medical problems should be treated, and adequate fluids and nutrition provided. These medical interventions, however, should not undermine the anxiety and dislocation that the various interrogation techniques are designed to foster. Medical assessments during periods of enhanced interrogation, while encompassing all that is medically necessary, should not appear overly attentive. Follow-up evaluations during this period may be performed in the guise of a guard or through remote video. All interventions, assessments and evaluations should be coordinated with the Chief of Site and interrogation team members to insure they are performed in such a way as to minimize undermining interrogation aims to obtain critical intelligence.

Medications and nutritional supplements may be hidden in the basic food provided (e.g. as a liquid or thoroughly crushed tablet). If during the initial phase of interrogation detainees are deprived of all measurements of time (e.g., through continuous light and variable schedules), a time-rigid administration of medication (or nutrition) should be avoided. There generally is ample latitude to allow varying treatment intervals.

The basic diet during the period of enhanced interrogation need not be palatable, but should include adequate fluids and nutrition. Actual consumption should be monitored and recorded. Liquid Ensure (or equivalent) is a good way to assure that there is adequate nutrition. Brief periods during which food is withheld (24-48 hours) as an adjunct to interrogation are acceptable. Individuals refusing adequate liquids during this stage should have fluids administered at the earliest signs of dehydration. For reasons of staff safety, the rectal tube is an acceptable method of delivery. If there is any question about adequacy of fluid intake, urinary output also should be monitored and recorded.

Uncomfortably cool environments

Detainees can safely be placed in uncomfortably cool environments for varying lengths of time, ranging from hours to days. The length of time will depend on multiple factors, including age, health, extent of clothing, and freedom of movement. Individual tolerance and safety have to be assessed on a case by case basis, and continuously reevaluated over time. The following guidelines and reference points are intended to assist the medical staff in advising on acceptable lower ambient temperatures in certain operational settings. The comments assume the subject is a young, healthy, dry, lightly clothed individual sheltered from wind, i.e., that they are a typical detainee.

Core body temperature falls after more than 2 hours at an ambient temperature of 10°C/50°F. At this temperature increased metabolic rate cannot compensate for heat loss. The WHO recommended minimum indoor temperature is 18°C/64°F. The "thermoneutral zone" where minimal compensatory activity is required to maintain core temperature is 20°C/68°F to 30°C/86°F. Within the thermoneutral zone, 26°C/78°F is considered optimally comfortable for lightly clothed individuals and 30°C/86°F for naked individuals. Currently, D/CTC policy stipulates 24-26°C as the detention cell and interrogation room temperatures, permitting variations due to season. This has proven more achievable in some Sites than others.

If there is any possibility that ambient temperatures are below the thermoneutral range, they should be monitored and the actual temperatures documented. Occasionally, as part of the interrogation process they are housed in spaces with ambient temperatures of between 13°C/55°F and 16°C/60°F. Unless the detainee is clothed and standing, or sitting on a mat, this exposure should not be continued for longer than 2-3 hours.

At ambient temperatures below 18°C/64°F, detainees should be monitored for the development of hypothermia. This risk is greatest in those who are naked or nearly so, who are in substantial direct contact with a surface that conducts heat away from the body (e.g., the floor), whose restraints severely limit muscle work, who have comparatively little muscle mass, who are fatigued and sleep deprived, and are age 45 or over.

Wet skin or clothing places a detainee at much greater risk for hypothermia, so if a partial or complete soaking is used in conjunction with the interrogation, or even for bathing, the detainee must be dry before being placed in a space with an ambient temperature below 26°C/78°F.

Signs of mild hypothermia (body temp 90-98°F) include shivering, lack of coordination (fumbling hands, stumbling), slurred speech, memory loss, and pale and cold skin. Detainees exhibiting any of these signs should be allowed some combination of increased clothing, floor mat, more freedom of movement, and increased ambient temperature.

Moderate hypothermia (body temperature of 86-90°F) is present when shivering stops, there is an inability to walk or stand, and/or the subject is confused/irrational. An aggressive medical intervention is warranted in these cases.

White noise or loud music

As a practical guide, there is no permanent hearing risk for continuous, 24-hours-a-day exposures to sound at 82 dB or lower; at 84 dB for up to 18 hours a day; 90 dB for up to 8 hours, 95 dB for 4 hours, and 100 dB for 2 hours. If necessary, instruments can be provided to measure these ambient sound levels. In general, sound in the dB 80-99 range is experienced as loud; above 100 dB as uncomfortably loud. Common reference points include garbage disposer (80 dB), cockpit of propeller aircraft (88 dB), shouted conversation (90 dB), motorcycles at 25 feet (90 dB), inside of subway car at 35 mph (95 dB), power mower (96 dB), chain saw (110 dB), and live rock band (114 dB). For purposes of interrogation, D/CTC has set a policy that no white noise and no loud noise used in the interrogation process should exceed 79 DB.

Shackling

Shackling in non-stressful positions requires only monitoring for the development of pressure sores with appropriate treatment and adjustment of the shackles as required. Should shackle-related lesions develop, early intervention is important to avoid the

TOP SE(b)(1)
(b)(3) NatSecAct

development of an interrogation-limiting cellulitis. Cleaning the lesion, and a slight loosening of the shackles may be all that is required.

If the detainee is to be shackled standing with hands at or above the head (as part of a sleep deprivation protocol), the medical assessment should include a pre-check for anatomic factors that might influence how long the arms could be elevated. This would include shoulder range of motion, pulses in neutral and elevated positions, a check for bruits, and assessment of the basic sensorimotor status of the upper extremities.

Assuming no medical contraindications are found, extended periods (up to 72 hours) in a standing position can be approved if the hands are no higher than head level and weight is borne fully by the lower extremities. Detainees who have one foot or leg casted or who lost part of a lower extremity to amputation should be monitored carefully for the development of excessive edema in the weight-supporting leg. If edema approaches knee level, these individuals should be shifted to a foot-elevated, seated or reclining sleep-deprivation position. In the presence of a suspected lower limb cellulitis, the detainee should be shifted to a seated leg-elevated position, and antibiotics begun. Absent other contraindications, sleep deprivation can be continued in both these circumstances..

NOTE: An occasional detainee placed in a standing stress position has developed lower limb tenderness and erythema, in addition to an ascending edema, which initially have not been easily distinguished from a progressive cellulitis or venous thrombosis. These typically have been associated with pre-existing abrasions or ulcerations from shackling at the time of initial rendition. In order to best inform future medical judgments and recommendations, the presence of these lesions should be accurately described before the standing stress position is employed. In all cases approximately daily observations should be recorded which document the length of time the detainee has been in the stress position, and level of any developing edema or erythema.

More stressful shackled positions may also be approved for shorter intervals, e.g. during an interrogation session or between sessions. The arms can be elevated above the head (elbows not locked) for roughly two hours without great concern. Reasonable judgment should be used as to the angle of elevation of the arms.

Periods in this arms-elevated shackle position lasting between two and four hours would merit caution, and subject should be monitored for excessive distress. The detainee should never be required to bear weight on the upper extremities, and the utilization of this technique should not exceed approximately 4 hours in a 24 hour period. If through fatigue or otherwise the detainee becomes truly incapable of supporting himself on his feet (e.g., after 36, 48 hours, etc.), and the detainee's weight is shifted to the shackles, the use of overhead shackles should be discontinued.

Sleep deprivation

Sleep deprivation (with or without associated stress positions) is among the most effective adjuncts to interrogation, and is the only technique with a demonstrably cumulative effect—the longer the deprivation (to a point), the more effective the impact. The standard approval for sleep deprivation, per se (without regard to shackling position) is 72 hours. Extension of sleep deprivation beyond 72 continuous hours is considered an enhanced measure, which requires D/CTC prior approval. The amount of sleep required between deprivation periods depends on the intended purpose of the sleep deprivation. If it is intended to be one element in the process of demonstrating helplessness in an unpleasant environment, a short nap of two or so hours would be sufficient. Perceptual distortion effects are not uncommon after 96 hours of sleep deprivation, but frank psychosis is very rare. Cognitive effects, of course, are common. If it is desired that the subject be reasonably attentive, and clear-thinking during the interrogation, at least a 6 hour recovery should be allowed. Current D/CTC policy requires 4 hours sleep once the 72 hour limit has been met during standard interrogation measures.

NOTE: Examinations performed during periods of sleep deprivation should include the current number of hours without sleep; and, if only a brief rest preceded this period, the specifics of the previous deprivation also should be recorded.

Cramped confinement (Confinement boxes)

Detainees can be placed in awkward boxes, specifically constructed for this purpose. These can be rectangular and just over the detainee's height, not much wider than his body, and comparatively shallow, or they can be small cubes allowing little more than a cross-legged sitting position. These have not proved particularly effective, as they may become a safehaven offering a respite from interrogation. Assuming no significant medical conditions (e.g., cardiovascular, musculoskeletal) are present, confinement in the small box is allowable up to 2 hours. Confinement in the large box is limited to 8 consecutive hours, up to a total of 18 hours a day.

Waterboard

This is by far the most traumatic of the enhanced interrogation techniques. The historical context here was limited knowledge of the use of the waterboard in SERE training (several hundred trainees experience it every year or two). In the SERE model the subject is immobilized on his back, and his forehead and eyes covered with a cloth. A stream of water is directed at the upper lip. Resistant subjects then have the cloth lowered to cover the nose and mouth, as the water continues to be applied, fully saturating the cloth, and precluding the passage of air. Relatively little water enters the mouth. The occlusion (which may be partial) lasts no more than 20 seconds. On removal of the cloth, the subject is immediately able to breathe, but continues to have water directed at the upper lip to prolong the effect. This process can continue for several minutes, and involve up to 15 canteen cups of water. Ostensibly the primary desired effect derives from the sense of suffocation resulting from the wet cloth temporarily occluding the nose and mouth, and psychological impact of the continued application of water after the cloth is removed. SERE trainees usually have only a single exposure to this technique, and never more than two; SERE trainers consider it their most effective technique, and deem it virtually irresistible in the training setting.

Our very limited experience with the waterboard is different. The subjects were positioned on the back but in a slightly head down (Trendelenburg) position (to protect somewhat against aspiration). A good air seal seemingly was not easily achieved by the wet cloth, and the occlusion was further compromised by the subject attempting to drink the applied water. The result was that copious amounts of water sometimes were used-up to several liters of water (bottled if local water is unsafe, and with 1 tsp salt/liter if significant swallowing takes place). The resulting occlusion was primarily from water filling the nasopharynx, breathholding, and much less frequently the oropharynx being filled—rather than the "sealing" effect of the saturated cloth. D/CTC policy set an occlusion limit of 40 seconds, though this was very rarely reached. Additionally, the procedure was repeated sequentially several times, for several sessions a day, and this process extended with varying degrees of frequency/intensity for over a week.

While SERE trainers believe that trainees are unable to maintain psychological resistance to the waterboard, our experience was otherwise. Subjects unquestionably can withstand a large number of applications, with no seeming cumulative impact beyond their strong aversion to the experience. Whether the waterboard offers a more effective alternative to sleep deprivation and/or stress positions, or is an effective supplement to these techniques is not yet known.

The SERE training program has applied the waterboard technique (single exposure) to trainees for years, and reportedly there have been thousands of applications without significant or lasting medical complications. The procedure nonetheless carries some risks, particularly when repeated a large number of times or when applied to an individual less fit than a typical SERE trainee. Several medical dimensions need to be monitored to ensure the safety of the subject.

Before employing this technique there needs to be reasonable assurance that the subject does not have serious heart or lung disease, particularly any obstructive airway disease or respiratory compromise from morbid obesity. He also must have stable anterior dentition, no recent facial or jaw injuries, and an intact gag reflex. Since vomiting may be associated with these sessions, diet should be liquid during the phase of interrogation when use of the waterboard is likely, and the subject should be NPO (other than water) for at least 4 hours before any session. The most obvious serious complication would be a respiratory arrest associated with laryngospasm, so the medical team must be prepared to respond immediately to this crisis; preferably the physician will be in the treatment room. Warning signs of this or other impending respiratory complications include hoarseness, persisting cough, wheezing, stridor, or difficulty clearing the airway. If these develop, use of the waterboard should be discontinued for at least 24 hours. If they recur with later applications of the waterboard, its use should be stopped. Mock applications need not be limited. In all cases in which there has been a suggestion of aspiration, the subject should be observed for signs of a subsequently developing pneumonia.

In our limited experience, extensive sustained use of the waterboard can introduce new risks. Most seriously, for reasons of physical fatigue or psychological resignation, the subject may simply give up, allowing excessive filling of the airways and loss of consciousness. An unresponsive subject should be righted immediately, and the interrogator should deliver a sub-xyphoid thrust to expel the water. If this fails to restore normal breathing, aggressive medical intervention is required. Any subject who has reached this degree of compromise is not considered an appropriate candidate for the waterboard, and the physician on the scene can not approve further use of the waterboard without specific C/OMS consultation and approval.

A rigid guide to medically approved use of the waterboard in essentially healthy individuals is not possible, as safety will depend on how the water is applied and the specific response each time it is used. The following general guidelines are based on very limited knowledge, drawn from very few subjects whose experience and response was quite varied. These represent only the medical guidelines; legal guidelines also are operative and may be more restrictive.

A series (within a "session") of several relatively rapid waterboard applications is medically acceptable in all healthy subjects, so long as there is no indication of some emerging vulnerability (such as hoarseness, wheezing, persisting cough or difficulty clearing the airways). Several such sessions per 24 hours have been employed without apparent medical complication. The exact number of sessions cannot be prescribed, and will depend on the response to each. If more than 3 sessions of 5 or more applications are envisioned within a 24 hours period, a careful medical reassessment must be made before each later session.

By days 3-5 of an aggressive program, cumulative effects become a potential concern. Without any hard data to quantify either this risk or the advantages of this technique, we believe that beyond this point continued intense waterboard applications may not be medically appropriate. Continued aggressive use of the waterboard beyond this point should be reviewed by the HVT team in consultation with Headquarters prior to any further aggressive use. (Absent medical contraindications, sporadic use probably carries little risk.) Beyond the increased medical concern (for both acute and long term effects, including PTSD), there possibly would be desensitization to the technique. Sleep deprivation is a medically less risky option, and sleep deprivation (and stress positions) also can be used to prolong the period of moderate use of the waterboard, by reducing the intensity of its early use through the interposition of these other techniques.

NOTE: In order to best inform future medical judgments and recommendations, it is important that every application of the waterboard be thoroughly documented: how long each application (and the entire procedure) lasted, how much water was used in the process (realizing that much splashes off), how exactly the water was applied, if a seal was achieved, if the naso- or oropharynx was filled, what sort of volume was expelled, how long was the break between applications, and how the subject looked between each treatment.

POST-INTERROGATION DETENTION [this section is still under construction]

OMS' responsibility for the medical and psychological well-being of detainees does not end when detainees emerge from the interrogation phase. Documented periodic medical and psychological re-evaluations are necessary during the debriefing phase which follows interrogation, as well as during subsequent periods of custodial detention. Absent any specific complaint, these can be at approximately monthly intervals. Acute problems must be addressed at the time of presentation. As during the interrogation phase, all assessments examinations, and evaluations should be reported through approved (b)(3) NatSecAct communications channels applicable to the site in which the detainee is held, and subject to review/release by the Chief of that site.

नुर(b)(1);ensoz (b)(3) NatSecAct

Detainee weights should be recorded on at least a monthly basis, and assessed for indications of inadequate nutrition. As a rule of thumb, "ideal" weight for height should be about 106 pounds for an individual 5 feet tall, and six pounds heavier for each additional inch of height. Terrorists incarcerated in the Federal prison system whose weights fall below this level are given nutritional supplements. Those falling to 90% of these levels who are unwilling to take nutrition orally (through hunger strikes) have forced feedings through a naso-gastric tube. While to date this has not been an issue with detainees, should significant weight loss develop it must be carefully assessed. It is possible that a detainee will simply be of slight build, but true weight loss in an already slight individual—especially in association with deliberately reduced intake—may require some intervention.

Additionally, if there are sustained periods without exposure to sunlight, the diet will need to be further supplemented with calcium and vitamin D. Simply increasing the use of multi-vitamins will give too much of one substance but not enough of another. The OMS recommendation for this situation is two 500 mg tables of plain calcium a day (such as two Os-Cal 500 mg tabs) with one capsule of the prescription Rocaltrol; or alternatively two Centrum Silver tablets (slightly less than the recommendation for vitamin D) with an additional 500 mg of a plain calcium table.

As the period of interrogation or intense debriefing passes, detainees may be left alone for increasing periods of time before being transferred elsewhere. Personal hygiene issues likely will emerge during this time, with the possible development of significant medical problems. It is particularly important that cells be kept clean during this period and that there be some provision for regular bathing, and dental hygiene, and that detainees be monitored to insure they are involved in self-care.

Psychological problems are more likely to emerge in those no longer in active debriefings, especially those in prolonged, total isolation. The loss of involvement with the debriefing staff should be replaced with other forms of interaction—through daily encounters with more than one custodial staff member, and the provision of reading materials (preferably in Arabic) and other forms of mental stimulation.
